Bombay 400 023,
India.

INTRODUCTION

Wind is a free, clean, inexhaustible energy source. Sufficient energy is continually being transferred from the sun to the winds of the earth to maintain an estimated total power capacity of over 10^{11} gigawatts (GW) in these winds. It is theoretically possible to recover about 60% of the energy in the wind (extracting all the energy would mean bringing all the wind to a dead stop, an interesting possibility). However, subtracting the inevitable losses due to turbines/propellers, it is possible to recover only 35% of the total wind energy available at a particular site.

The use of wind as a source of energy is an old approach dating back some 2000 years to the Persian windmills. The traditional applications of wind have been to pump water for domestic uses such as livestock and irrigating crops to perform agricultural tasks such as grinding corn, crushing sugar cane threshing and wood cutting, for speciality applications such as moving saline water in salt works. By the turn of the last century, windmills were widely used for generating electricity. It is estimated that there were more than 0.6 million windmills operating in the world by the end of the last decade. In recent years, there have been attempts by organizations in both industrialized and developing countries to meld wind energy and more advanced technologies into usable forms. Feasibility studies have been initiated in a number of countries to assess the technical and economical problems of wind energy for a number of different applications.

The main effort in the developing countries is to design and fabricate simple, low cost windmill using locally available material and skill, mainly for agricultural applications.

Large government funded R&D programmes are in progress in the U.S.A. (\$60 million in fiscal year 1978-79), Sweden (\$20 million in triennium starting with fiscal year 1978-79), Canada, Denmark, West Germany, Holland and the U.K. (the latter five countries are each funded at over \$1 million). These programmes include the construction of large (megawatt rated) and/or medium (hundred kilowatt rated) prototype wind generators; studies of structural dynamics; wind energy prospecting; data analysis and resource assessment; development of electrical and mechanical systems; computer studies of the integration of wind generators into electricity grids and economic studies. Current active programmes,

nationally sponsored are in Denmark, Sweden, West Germany, Netherlands, England, New Zealand, Canada and U.S.A.

Presented here in this directory are the activities of associations, organizations, institutions, universities, colleges, etc., involved in the field of wind energy in several countries.

Tata Energy Research Institute is grateful to all those who have contributed to this publication. The Institute proposes to report even more comprehensively on wind energy developments and usage worldwide. It seeks cooperation of all the organisations and individuals active in the field in reporting activities that should be included in the Directory to make it comprehensive and up-to-date. Any organisation inadvertently omitted here will find place in subsequent edition of the Directory.

EXPLANATORY NOTES

- The Directory is based on questionnaire survey supplemented by research in existing directories and conference proceedings.
 - Main text is arranged in alphabetical order by country. Manufacturers' section is also in alphabetical order.
 - Organizational profile consists of information such as name and address, contact person, activities, publications, personnel. Manufacturers' profile in addition includes information on products manufactured, and product specifications.
 - Asterisks (*) prefixed to the entry indicates that the information is extracted from published literature and directories.
-

INTERNATIONAL ORGANIZATIONS

1. * Economic Commission for Africa,
P.O. Box 3001,
Addis Ababa,
Ethiopia.

Telephone : 447200

Cable : ECA ADDISABABA

Telex : 21029

The Commission is assisting in the establishment of the African Solar Energy Society and an Africa Solar Energy Centre. An intergovernmental meeting on new and renewable sources of energy in Africa was organized in January 1981 in Addis Ababa, Ethiopia.

2. * Economic Commission for Asia and the Pacific (ESCAP),
United Nations Building,
Rajadamnern Avenue,
Bangkok 2,
Thailand.

Telephone : 28291 61

Cable : ESCAP BANGKOK

Telex : 788 2392

Since 1974, one of the activities of ESCAP has been to investigate, develop and manage non-conventional energy resources. In 1976, ESCAP considered a report prepared by experts on the use of solar and wind energy in the ESCAP region for the purpose of regional coordination.

A field mission has been undertaken by ESCAP in 14 developing countries of the region.

ESCAP has plans to convene a seminar on planning management and economics of energy for rural areas during the second quarter of 1981. Directories of institutions and experts in the ESCAP region involved in the research and development of solar energy, wind energy, mini-hydropower and biogas are being prepared.

3. * Economic Commission for Europe,
Palais des Nations,
CH-1211 Geneva 10,
Switzerland.

Telephone : 34 60 11

Cable : UNATIONS GENEVA

Telex : 289696

ECE organised a Seminar on Technologies related to New Energy Sources at the Julich Nuclear Research Centre in the Federal Republic of Germany from December 8-12, 1980, covering solar, wind and geothermal energy as well as problems associated with the integration of new energy sources into existing power systems.

4. * The Department of Technical Cooperation for
Development (DTCD),
The U.N. Centre for Natural Resources, Energy and
Transport (CNRET),
New York, N.Y. 10017,
U.S.A.

Telephone : 7548575

Cable : 'UNATIONS NEWYORK'

Telex : 232422

In the Department of Technical Cooperation for Development, the CNRET is responsible in the field of natural resources, energy or transport and notably in the field of Solar and Wind Energy.

The Department prepared programmes on Solar and Wind Energy in the Cape Verde Islands (1976) in El Salvador (1977) and in the Sahelian region.

The Centre is also responsible for monitoring a project to set up Rural Energy Centres in Africa and Asia, to serve as demonstration units. The main concept of the Rural Energy Centres (REC) is the "energy mix" whereby solar energy, wind and biogas will complement each other for supplying energy for cooking, lighting, water pumping and running agro-based village industries. Sites have been selected in Senegal (at Ndia Gorey), Sri Lanka (at Pattiyaipola) and in Mexico.

5. * The General Assembly and The United Nations
Conference on New and Renewable Sources of Energy,
1, United National Plaza,
New York, N.Y. 10017,
U.S.A.

The General Assembly at its last session in December 1978 approved the convening of a UN Conference on New and Renewable Sources of Energy to be held in 1981. The Conference will be held in Kenya from August 10-21, 1981. The objective of this Conference will be to promote the development and utilization of wind energy among other renewable energy sources.

6. * United Nations Children's Fund (UNICEF),
United Nations Plaza,
New York, N.Y. 10017,
U.S.A.

Telephone : 754-1234 Cable : UNICEF NEWYORK
Telex : 127895 (Western Union)

A UNICEF "Village Technology Unit" has been established in Kenya, jointly with the government's village Polytechnic Programme. Energy related demonstration and experimental equipment include wind powered water pumps. Windmills are being used by rural communities in N.E. Kenya with the help of UNICEF.

During 1976, UNICEF sponsored a regional seminar in Kenya, which was attended by 10 countries to explore the use of appropriate technologies in the rural areas of the world. In 1977, the Executive Board of UNICEF approved assistance to six African countries to establish village-level technology measures and training staff.

The organization sponsors visits of many people from different parts of developing countries to the projects.

7. * United Nations Development Programme (UNDP),
1, United Nations Plaza,
New York, N.Y. 10017,
U.S.A.
Telephone : 754-1234 Cable : 'UNDEVPRO NEWYORK'
Telex : 125980

The UNDP funds feasibility studies and technical cooperation projects at the request of Governments. It sponsors several projects concerning solar energy (which includes wind energy) applications, which are carried out by CNRET or by specialized agencies and bodies inside or outside the United Nations System.

Wind energy projects sponsored by UNDP are :

- 1) In Jamaica, on the possible use of alternative sources of energy including wind and waves.
- 2) In Kenya, on the feasibility of manufacturing wind powered water pumping equipment in Mbita Division, South Nyanza with UNIDO.

UNDP is also sponsoring regional projects

- for cooperation among Mediterranean countries on solar and wind energy;
- in Central and S. America on the potential of conventional and non-conventional energy development.

8. * United Nations Educational Scientific and
Cultural Organization (UNESCO),
7, place de Fontenoy,
F-75700 Paris,
France.

Telephone : 577 1610 Cable : 'UNESCO PARIS'
Telex : 204461 PARIS

UNESCO has carried out a survey and analysis of programmes, facilities and needs in the field of education and training related to new and renewable sources of energy. As a step towards a more structured system for collecting and dissemination information

on new and renewable sources of energy (including wind energy), UNESCO has recently completed a study for an international information system in this area.

UNESCO continues a programme of work in the field of non-conventional sources of energy which comprises the following activities : -

- 1) Promotion of research in the scientific and technological field by sponsoring and co-sponsoring conferences and expert missions, publications and similar other activities.
- 2) Assistance in the creation or development of regional or sub-regional centres for research and training in solar/wind energy.

9. * United Nations Environment Programme (UNEP),
P.O. Box 30552,
Nairobi,
Kenya.

Telephone : 333930 Cable : 'UNITERRA NAIROBI'
Telex : 22068

UNEP has been assisting developing countries in dealing with their environmental problems. UNEP prepared a proposal for a study on the impact on the environment of the various sources of energy, including solar and wind energy, submitted in April 1979.

UNEP is also engaged in a project to set up Rural Energy Centres in Africa and Asia to serve as demonstration units with the object of encouraging developing countries to use alternative sources of energy. The main concept of the Rural Energy Centres as planned by UNEP is the "energy mix" whereby solar energy, wind energy and biogas will complement each other in supplying energy for the village.

10. * The United Nations Industrial Development
Organization (UNIDO),

Vienna International Centre,
Wagramer Strasse 5,
P.O. Box 300,
A-1400 Vienna,
Austria.

Telephone : 26310 Cable : 'UNIDO VIENNA'

Telex : 135612

UNIDO provides technical assistance to developing countries on their request, for projects related in manufacturing of solar equipments. The components of this technical assistance may be in terms of experts, equipments or fellowships.

In Kenya, UNIDO sponsored a programme for the design of windmill-pumping equipment.

11. * United Nations University,
15-1 Shibuya 2 chome,
Shibuya-ku,
Tokyo 150,
Japan.

Telephone : 499-2811 Cable : 'UNATUNIV TOKYO'

Telex : J25442

The UN University, founded in 1973, has its headquarters in Tokyo and a network of research and advanced training operations in some 60 countries. It has undertaken pilot projects on solar, biogas and wind energy in rural communities in the developing countries.

UNU publishes a monthly periodical "ASSET, Abstracts of Selected Solar Energy Technology" which has a section on Wind Energy.

12. * Organization for European Economic
Cooperation (OEEC),
Chateau de la Muette,
2, rue Andre Pascal,
75775 Paris, Cedex 16,
France.

OEEC group was established early in 1950 to encourage cooperative research and development in wind power. The group has held several meetings in Paris and in London which have been attended by representatives of a number of European countries that have wind power potentialities.

The most important outcome of the group's establishment has been the free exchange of information on the national activities in the subject and of ideas for future developments.

13. * The World Meteorological Organization (WMO),
Case Postale 5,
CH-1211, Geneva 20,
Switzerland.

The World Meteorological Organization has established in 1976 a Plan of Action in the field of energy problems. The programme is mainly directed to the implementation of a wide range of research and development activities in the application of meteorology including the use of wind and solar radiation. Under this programme a system has been established to exchange meteorological information between the interested member countries.

To promote the utilization of non-conventional sources of energy, specifically solar radiation and wind, particularly in the rural areas and developing countries, WMO has elaborated a project with the support of UN Environmental Programme, concerning the meteorological aspects of the utilization of the radiation and wind energy.

To assist developing countries in preparing a sound meteorological basis for consideration of local climatic conditions, WMO experts are sent, on request, to provide the required advice.

14. Food & Agricultural Organization (FAO)
of the United Nations,
Via delle Terme di Caracalla,
00100 Rome,
Italy.

Telephone : 57971 Cable: 'FOODAGRI ROME'
Telex: 61181 FOODAGRI

Contact : H. J. von Huelst, Chief Agricultural
Engineering Service.

The main emphasis of FAO's energy activities is the introduction and extension of proven or promising technologies in developing countries. FAO has published a book 'Energy for World Agriculture' which includes a section on wind energy.

AUSTRALIA

General meteorological data and basic theoretical meteorology suggest that regions of high wind-energy potential exist around the coasts of the Great Australian Bight, the south-west of Western Australia, part of Victoria and the west of Tasmania. It has been suggested that the south-west coast of Western Australia between Cape Naturaliste and Albany might support an annual average wind power of about 280 MW, assuming two lines of MW rated aerogenerators. About 2000 km of South Australia coastline might support an annual average wind power of about 2000 MW, again assuming two lines of MW rated generators. The northern part of Tasmania's west coast might support an average power of 200-400 MW.

Australian energy research, development and demonstration grants have been offered to the following current projects :

- 1) Integration of wind power on a large scale into state electricity grids with short term storage carried out by Commonwealth Scientific and Industrial Research Organization (CSIRO) Division of Mathematics and Statistics, which aims on understanding fully the rate that wind power could play in the large scale generation of electricity in Australia.
- 2) Vertical Axis Wind Turbine : Carried out by the Flinders University of South Australia, aims to develop, demonstrate and test a simple, inexpensive vertical axis wind turbine.
- 3) Hybrid photovoltaic, wind generator and diesel generator power supply system for small scale remote area use : Project is under Dunlite Pty.Ltd. , to develop and construct a hybrid energy system to supply the electrical needs of a household from wind and solar derived sources. The knowledge gained will result in the development of commercially viable energy packages.
- 4) Generation of electricity in the tropopause : Carried out by University of Sydney relates to a feasibility study and certain wind tunnel tests.

Australia

- 5) Bass Strait wind energy study : Carried out by Hydro-electric Commission of Tasmania with the immediate aim of determining the detailed wind characteristics of the best sites for wind driven generators on King and Flinders Islands.

Australia has a small commercial industry (notably Dunlite Ltd.) with an international market for manufacture of wind generators (usually about 1 kw). Various projects on the small scale use of wind energy for electric power generation exist in government laboratories, tertiary institutions and private firms.

An Australasian Wind Energy Association is to be set up, the structure of which will be formalized at the first annual general meeting anticipated to be held in December 1980. The Association aims at encouraging wind energy utilization in Australia, New Zealand, and surrounding islands.

1. * Appropriate Technology and Community Environment
(APACE),

Box 81, Sydney University Union,
Wentworth Building,
Sydney, New South Wales 2006,
Australia.

Contact : Dr. J.R.E. Waddell, President.

Activities :

APACE is a voluntary organisation, drawing its support and expertise mainly from university staff.

Projects underway include :

- 1) Design of vertical axis windmill.
- 2) Design of a simple DC/AC inverter.
- 3) Design of housing complex to be powered by sun, wind and methane biogas.

APACE provides advisory service and plans in future to publish manuals and designs.

Publications :

A newspaper (published three times a year).

Australia

2. * Appropriate Technology Development Group (ATDG),
20, Holdsworth Street,
Woollahrg, New South Wales 2050,
Australia.

Telephone : 32 9705

Contact : Dr. Gordan Innes, President.

Activities :

ATDG was set up in 1976 as a small consulting group to work among developing nations (South Pacific and South East Asian Regions). ATDG provides its members expertise to assist in carrying out appropriate technology projects. Participated in development of a vertical axis wind turbine.

Publications :

Papers on appropriate technology and development.

3. Ballart College of Advanced Education,
Mt. Helen,
Victoria,
Australia 3350.

Telephone : 053 301 800

Contact : Dr. Len J. Cubitt, Lecturer, School of Engineering.

Activities :

Wind energy work commenced in 1976.

Specific activities are :

- 1) Wind data collection and evaluation.
- 2) Research and development : developing concrete windmill for farm type applications.

Budget :

\$2,000 per annum.

Publications :

Technical reports, research papers.

Australia

Windmill Installations :

Type of installation :	Laboratory scale and demonstration unit.
Type of windmill :	Vertical axis and horizontal axis.
Applications :	Water pumping and power generation.

Personnel :

Dr. Len J. Cubitt and Mr. Les McGrath.

Activities :

Wind energy work commenced in 1980.

Activities include :

- 1) Wind data collection and evaluation.
- 2) R&D Projects currently supported by SERIWA
 - a) Remote area power supply investigation (3 years beginning in 1979).
 - b) Wind generators for Rottnest Island (1980).
 - c) Radiation and wind monitoring stations.
- 3) Technical information dissemination

Budget :

Approx. \$200,000 for 1980/81.

Australia

Funding Source :

National Research Development and Demonstration Council, Solar Energy Research Institute of Western Australia; State Energy Commission of Western Australia.

Windmill Installations :

5 kw - Dunlite horizontal axis, demonstration unit.
50 kw - DAF, vertical axis windmill, 50 kw at 13 m/s 20 kw at 10 m/s - Rottnest Island.
22 kw - 1 MAN horizontal axis windmill, 22 kw at 5 m/s, 20 kw at 10 m/s - Rottnest Island.

Personnel .

T.S. Crawford, and W. Pedrick.

BRAZIL

Extensive analysis of wind data from 42 stations located in North East Brazil exposed the persistent characteristics of the winds that blow there. As only 25% of the hydroelectricity power in Brazil is utilized, a wind plant was planned to be competitive with hydro.

The persistence in direction of the winds has an advantage since it can help reduce the price of the wind plant project. It was estimated in 1976 that if the price of hydro electricity remains U.S. \$15/- per MW hour in Brazil, the system would pay for itself within approximately 8 years.

Windmills for pumping have been used in North East Brazil for a long time. However until now, no semi industrial plant has been constructed. The first experience was with a 20-30 kw unit for winds of 7 to 10 m/s. It is a 5 mt, fixed direction windmill. A 20 kw-117 V alternator is available commercially in Brazil.

Brazil imports about 450,000 tonnes of sodium hydroxide per year, also a large amount of the fish catch is actually lost for lack of freezing facilities. Aeolian Energy can be readily used in these cases.

CANADA

Canada now obtains over 10% of her energy supplies from renewable energies. Extensive meteorological studies have shown that while there is an excellent supply of wind available for energy production, it is unevenly distributed.

The National Research Council (NRC) has been assigned for coordination of the Renewable Energy Task which includes The Wind Energy Program. Wind Energy R/D has received about \$1 m per annum for the years 1978, 1979 which has increased to \$1½ m for 1980.

Wind energy research had begun in Canada long before the formal initiation of the current R/D program. In the early 1960's the Brace Research Institute at McGill University had begun the development of wind machines. In the late 1960's and early 1970's, the vertical axis "Eggbeater" wind turbine had been developed.

The Canadian R/D efforts have concentrated exclusively on the vertical axis wind turbines. Since industrial development and production engineering of the vertical axis wind turbine are considered to offer promise of substantial cost reduction, early emphasis was placed in the Canadian program on the transfer of this technology to Canadian manufacturing industry. It was also recognized early in the Canadian program, that electric power utilities and in particular those operating in parts of the country where large-scale wind energy potential is high should be invited to participate in the program. This led in 1976 to the NRC/Hydro Quebec Magdalen Island wind turbine (capacity 230 kw) project and to subsequent interest by Newfoundland and Labrador Power and by Saskatchewan Power Corporation in similar, but small scale pilot plants. In Canada industry has continued to make contributions to vertical axis turbine technology and still maintains a lead in this area.

NRC Wind Prospecting project will obtain wind speed measurements at selected sites in different parts of Canada, specifically chosen for their wind energy potential. Equipments were to be procured and installed at chosen sites during 1979/80.

Canada

Development and trial applications of small (100 kw) VA WT are proceeding on two parts. DAF-Indal Ltd., have been awarded contracts for 50 kw machines for application in Canada and the U.S. A hybrid (wind/diesel electric) system utilizing the 50 kw DAF rotor is being installed as a joint venture by Ontario Hydro, the Ontario Ministry of Energy and NRC. This project is seen as a potential prototype of a "stand-alone" power supply for remote communities. The remainder of Canadian installations of 50 kw DAF VAWT's are grid-coupled generators installed as joint projects between NRC and electrical utility companies.

As part of the Renewable Energy Incentives program announced in July 1978, two special projects in wind energy were identified. The first was the installation at Wreck Cove, Nova Scotia, of a wind turbine whose output was to raise water 50 feet from a nearby lake into the 1200 foot head pond of a hydroelectric generating station. The second project was the establishment on Prince Edward Island of an Atlantic Wind Turbine Test Site. NRC is expected to provide both technical guidance and support to both these projects.

1. National Research Council of Canada (NRC),
Energy R/D Program Branch,
Bldg. M-50, Montreal Road,
Ottawa, Ontario,
Canada K1A 0R6.

Telephone : 613-993-3405

Contact : M.S. Chappell, Manager, Wind Energy R/D Programme.

Activities :

Canadian R/D in renewable energy began in 1974 and is carried out in the private sectors under contract to the federal government. Current programme structure includes :

- 1) Resource assessment.
- 2) Technical development of small wind turbines.
- 3) Technical development of large wind turbines
(Vertical Axis Wind Turbines).

Canada

The near-term objectives of the Wind Energy R/D Programmes are to access, expand and exploit current advances in power generation to contribute to the solution of the energy programme in Canada. In the long term, export markets and industrial benefits will also be significant.

Budget :

Approx. \$1.2 m per annum for wind energy R/D program.

Funding Source :

Federal Government.

Publications :

Programme summaries, project evaluation reports, several technical reports ('Renewable Energy Research and Development in Canada' Dec. 1979).

Windmill Installations :

Several laboratory scale, demonstration units and actual use type of installation with a total of 5 grid coupled and 6 stand along units. Mainly vertical axis type of windmills for power generation and cathodic protection of pipeline.

windmills for water pumping.

Personnel :

Varies one to four.

CHINA

The monsoon-swept parts of China have very rich wind resources. Surveys show that wind energy is mainly distributed over the vast grasslands on the Qinghai-Tibet Plateau and the Inner Mongolia Highlands and along the south-east coast. The annual mean windspeed in the pastoral areas is 4-4.5 m/s. In coastal areas of Zhejiang and Fujian provinces in east China, wind with a velocity over 8 m/s blows for 5500 h/year. Exploiting such favourable natural condition and developing wind power generation is an important way to achieve electrification in these areas.

The experimental wind-power stations have been listed as a major scientific research item in China. The Chinese Ministry of Power Industry has set as a goal the production and popularisation of small wind-driven generators which are reliable, simple and inexpensive and which are in line with China's technological and physical capabilities.

An 18 kw prototype wind turbine generator has been installed at Sijiao Island, off the east coast of China and is working well since it was installed last year. The turbine rotor of 13 m diameter starts generating when the wind velocity reaches 4 m/s and operates at full capacity when the velocity reaches 8 m/s.

The wind driven generating unit is the biggest of its kind designed and made so far in China. In addition to lighting fishermen's households on the island, it supplies power for 1 m³/h desalination and for electric welding. Based on the operating experience of this test set the Zhejiang provincial machine building department is now designing and manufacturing 40 kw wind turbine generators.

A 2 kw wind turbine-generator with three steel blades 4 m in diameter installed on a 9 m high tower has been operating for more than a year at a remote railway station located in Xinjiang's Turpan Depression. The wind turbine generator supplies electricity for the railway station's signalling and lighting systems and nearby households.

Several hundred wind driven generators, with capacities between 100 W and 250 W have been made in Inner Mongolia, Shanghai, and Heilongjiang. Small wind-power generators each with a capacity of 2 kw are in trial operation on the grasslands of Inner Mongolia, Gansu and Heilongjiang provinces.

China

The Ministry of Power Industry and its research institution are continuing their experiments with medium sized generating units so as to standardise and perfect them to meet the pressing needs for electricity in remote areas.

DENMARK

The Danish wind power programme is being undertaken by the Ministry of Commerce in collaboration with the electric utility companies.

The growth in interest in wind power has been shown by (1) reports from Danish Academy of Technical Sciences (1975), (2) the construction, mainly by individuals of a number of small wind generators, five of which have been connected to the grid, (3) the renovation of the 200 kW Gedser wind generator jointly by ERDA of the U.S.A. and DEFG, the research organisation of the Danish electricity utilities (from 1957 to 1967 this machine had operated successfully while coupled to the grid), (4) significant papers from the Niel Bohr Institute on the amount of wind power capacity that can be inserted into a conventional electricity grid and on the role of short term storage in improving the availability of power from a set of wind generators at a single site.

Over the two years from December 1976, the Danish government has appropriated 14.26 M DKr. (\$2.4 M) and the DEFG 3 M DKr. towards a development program for medium-to-large wind generators.

Two windmills are being constructed at Nibe in Denmark, each with a triple-bladed 40 m diameter rotor and a design speed of 34 rpm, with maximum output 630 kW.

The world's largest wind generator, the Tvindmill, stands at Tvind, 10 km from the North Sea coast of Denmark began operating in 1978. Testing and proving of this 54 m three blade, community financed and built 'Tvindmill' have been completed successfully. The output is currently limited to 500 kw instead of its full rated power of 2 MW.

Research and development in Denmark is being carried out in 3 major areas

1. Assessment of wind resources.
2. Large Wind Machines : Design, construction and operation of large conversion systems (600 kw); wind profiles; motor design and siting studies for 1000-2000 systems.

Denmark

3. Small Wind Machines : Field tests of small windmills; combination of windmills and torque converters; wind power for heating agricultural estates; integrated wind power heating scheme.

1. Institute of Agricultural Engineering,

Denmark.

Telephone : (02) 992613

Contact : Mr. Richard Matzen, Asst. Prof.

Activities :

Work commenced in 1973.

Main activity is converting wind energy into heat, development of water-brakes.

Funding Source :

University Research.

Publications :

Technical reports and research papers ('Wind Energy - Heat Generation (Publ. 1978)').

Windmill Installations :

Demonstration units and actually operating horizontal axis windmills for heat generation and agricultural tasks.

Personnel :

Mr. Richard Matzen, and Mr. S. Sonne Kofoed.

Denmark

2. * Riso National Laboratory,
DK-4000 Roskilde,
Denmark.

Contact : Helge Peterson.

Activities :

1. The main activity of RISO National Lab. is to establish and run a test plant for small windmills. Planning of the plant was initiated in 1978. 7 platforms for windmills have been erected and the data sampling and handling system had been completed and tested.
2. RISO also offers consulting assistance to designers (given free of charge to manufacturers).

Budget :

Danish Kr. 5.5 million for period of 3 years ending in the beginning of 1981.

Funding Source :

Ministry of Energy.

Publications :

Research papers, reports ('Small Windmills in Denmark' (Feb. 1980) describes completely the project for small windmills funded by the Ministry of Energy, with a survey of Danish windmills).

Personnel :

Staff of the test plant consists of 2 academic engineers and 2 technicians. A group of 4 more academic engineers is associated with the test plant performance development work and production cost analyses based on windmill experience at the test plant.

FEDERAL REPUBLIC OF GERMANY (FRG)

Meteorological data and analysis indicate that the maximum technical potential of wind energy in FRG is 220 Twh/yr.

Research and development in FRG have been carried out on three lines :

1. Acquisition and processing of wind data; meteorological measurements; wind condition in FRG.
2. High Capacity Power Plants : Development, construction and testing of a 52 m rotor diameter prototype (265 kw). Engineering study of a 1-2 MW power plant, design, storage systems, rotor blades, dynamic behaviour.
3. Small Wind Power Systems : Development of 5.5 m rotor diameter vertical axis converter; evaluation of 15 kw power plant.

The West Germany Ministry for Research and Technology (BMFT) for the purpose of wind energy research granted DM 100 million. One of the major research project of West Germany was to work on the large scale wind energy plant "Growian" one of the world's largest modern windmill. The windmill developed by the firm Maschinenfabrik Augsburg-Nurn-berg in cooperation with Stuttgart University, Kassel College and the German Air Space Research and Experimental Institute in Cologne will be capable of producing 3 MW of electricity.

The project also includes construction of 5 smaller wind power plants, each with an output of 10 kw near the Elbe river. A medium size plant with a capacity of 270 kw developed by Voith (Heidenheim) was to be erected in the Swabian Alb region.

Windmill Installations :

Demonstration units of vertical axis, horizontal axis windmills and flapping vane wind pump, for water pumping.

FRANCE

Studies by the Electricite de France indicated that France is well endowed with a large number of potential wind electric conversion sites. There are several sites at 40 m height above ground where annual power in France exceeds 3000 kWh/m².

The French built and operated several large and medium scale wind powered electric generators in the period from 1958 to 1966. These included three horizontal-axis units, each with three propeller type blades. A unit of this type was operated intermittently near Paris from 1958 to 1963. This unit was designed to generate 800 kw in winds of 37 mph. Two other units were constructed at St. Remy-des-Landes in Southern France. The larger of these units was rated at 1000 kw in winds of 37 mph. At present no effective research program has been established.

A new concept the flexible blade windmill (FBW) was developed in France through a joint Industry-University programme.

Both France and Switzerland are notable for the long-established manufacture of small-scale wind plant, at present up to 10 m diameter with current design activity in a higher range to meet developing autonomous market needs.

Laboratory scale and demonstration (model under construction), horizontal axis windmill for water pumping and power generation.

GREECE

Evidence of the availability of wind power in Greece is provided by the large number of wind motors which have been used extensively to grind cereals, press olive oil and pump water. These machines are either multivane farm fans introduced from the United States at the turn of the century, or Mediterranean sail windmills which are largely developed in Greece and have been used for several centuries. At least 6,000 of the later are still in use in the plain of Lassithion and several hundred are also used on the smaller Aegean islands.

In order to quantify the wind energy potential and to provide a basis for wind turbine selection and for cost calculations, wind statistics were obtained from the National Meteorological Service of Greece. The maximum available energy is highest in Amarillo (1919 kwh/m²), Dodge City (1609 kwh/m²) and Clayton (1601 kwh/m²). Since this region is considered to be among the windiest areas of the world (Clayton was the first site chosen for field testing of ERDA's 200 kw wind turbine) it becomes quite obvious that the wind in Greece contains substantial amounts of energy which can be used to decrease her dependence on imported oil.

The available wind energy is highest on the Aegean islands. The combination of small electrical loads, high generation costs and considerable amounts of available wind energy suggested that prototype units be installed and monitored on Kythera, Naxos, Skyros, Kos Milos and Samos (Aegean Islands). Studies have been made on the characteristics and performance of the proposed WTGs for the above 6 islands.

Search for windy sites on the mainland needs to be given attention in Greece.

INDIA

Data collected at more than 200 meteorological stations in India indicate that windspeed at nearly 10% of the stations have averaged more than 12 km/hr on an annual basic and that there are as many inland windy locations as coastal ones.

Attempts to utilize wind power in India began in 1950s. In 1952 a wind power sub-committee was constituted under the Council of Scientific and Industrial Research, New Delhi. This committee recommended conducting wind surveys at several locations, adapting a suitable windmill originally developed abroad, and simultaneously taking steps to design a windmill indigenously.

About 160 water-pumping windmills of the Southern Cross type were imported in the late fifties and installed at several locations in the country. During 1959-64 period, the windmill WP-2, developed at National Aeronautical Laboratory, was produced in batches and about 80 of these were erected for field trials at several places in the country. A few electricity generating windmills such as 'Algaier', 'Dunlite', and 'Elektro' were also tested for performance in Indian winds.

Since 1973, following developments are taking place

- 1) A few groups in India are constructing prototypes of Darrieus Rotors. At Bharat Heavy Electricals Ltd., Hyderabad, and Indian Institute of Technology, Madras, projects have been initiated for developing a Darrieus rotor for generating electricity at around 1-5 kw capacity. National Aeronautical Lab. programme is directed towards studying a parallel-blade variation of the Darrieus rotor.
- 2) Another line of development has followed the route of the Savonius rotor. The Application of Science and Technology in Rural Areas (ASTRA) Cell at Indian Institute of Science, Bangalore, has developed a modified design of the Savonius rotor, using wood, iron wires and cloth.
- 3) The third line of experiments has gone in the direction of the Cretan Sail Windmill. A sail windmill having a rotor diameter of 10 m was erected at Madurai in 1974 to pump water with the help of a reciprocating pump.

India

The ANILA WINDMILL designed and developed at Sri Murugappa Chettiar Research Centre bagged the Independence Day Invention Award of the National Research Development Corp. of India, 1979. Another significant work was at Indian Institute of Technology which developed a Wind Dial for measuring wind velocity and energy content under rural field conditions.

1. Aligarh Muslim University,
Z.H. Engineering College,
Mechanical Engg. Dept.,
Aligarh.

Telephone : 5970

Contact : Prof. S. Akhtar Husain.

Activities :

Wind energy work began in 1978.

Present activities are training and policy formulation. In future, plans are to develop windmills for water lifting and power generation.

Funding Source :

Aligarh Muslim University; University Grants Commission, Delhi.

Publications :

Research papers ('Wind power for bird scarer to be used in orchards and grain fields' (1978); 'Comfortable heating and cooling by solar reflectors and wind' 1978).

Windmill Installations :

Laboratory model for power generation and water pumping (one each). •

Personnel :

Prof. S. Akhtar Husain, Mr. Wasim Abbas (lecturer), Mr. F.A. Ansari (lecturer), and students (full time).

15. Tool-ORP Windmill Project,
Vill. Kusumih Kalan,
Post Box No. 62,
Ghazipur 233 001.

Contact : Major P. Sharan, General Manager.

Activities :

This project commenced in 1977 with current activities as under :

- 1) Wind data collection and evaluation.
- 2) Research and development : The organization has a research section located at Allahabad Polytechnic (U.P.). During 1978-1979, windmills were being experimented.
- 3) Production and marketing : Since beginning of 1980 windmills are manufactured for commercial sale.
- 4) Training courses in windmill technology at engineer's and mechanic's levels are organized every year.

Publications :

Technical reports, publicity brochures.

Budget :

Rs. 25, 52, 000 for the project.

Funding Source :

Govt. of Holland (Tool-Foundation); Govt. of India (PADI) and Organization of Rural Poor, Ghazipur.

Annual Earning :

In 1980 - Rs. 50, 000 till October from sale of windmills.

Windmill Specifications :

(Horizontal axis water pumping windmill).

Rotor diameter : 5 m.

No. of blades : 12.

Windspeed : Can operate in windspeed as low as 2.5 m/s.

India

Material of the windmill : Basic structure is steel.
Nylon bearing, wood and
PVC pipes.
Storage tank : Size 10 x 10 x 1.5 m.
Tower height : 7 m.
Windmill weight : 400 kg.
Capacity : 4 litres/sec. Pumps water
by which 1.2-1.4 hectare
of land can be irrigated
throughout the year.
Price : Rs. 5,500.

A smaller type of windmill (2 m rotor diameter) has
been designed by TOOL-ORP for low lift irrigation.

Activities :

Research and development started in 1974.
Several studies have been conducted on shrouded
aerogenerators (design, construction and perform-
ance); cost-effectiveness of vortex augmented wind
turbine.

Funding Source :

The U.S. -Israel Bi-National Science Foundation;
Jerusalem and the Israel Ministry of Energy.

Publications :

More than 7 research papers on shrouds and
shrouded wind turbines.

Windmill Installations :

- Laboratory scale and demonstration units of hori-
zontal axis windmill for power generation. .

JAPAN

It is reported that approximately 10% of the present total power consumption may be obtained from the winds. The development of a unique wind power utilization system suitable for Japan is highly expected.

Among the "Sunshine Schemes" planned by the Ministry of International Trade and Industry (MITI) study committee for wind energy systems was established in 1977, and at the Science and Technology Agency, a special study committee was set up and the report on the study for wind energy utilization was made and the preparation of a concrete wind energy utilization project is now underway. In 1977, the Japan Wind Energy Association was established. Thus the R&D system for the wind power utilization in Japan has gradually been consolidated jointly with governmental and private efforts.

A NU-101 axial flow type wind turbine was built in 1973 for electric power generation at observation base in Antarctic Continent. A wind power generation system for a beacon developed at the maritime safety test center of the Maritime Safety Agency was installed in 1976. It is of a 5 blade propeller type with a diameter of 2.25 m design point wind velocity of 4.5 m/sec and power output of 30 W.

A propeller type wind power generator was developed by the Japan Telephone and Telegraph Corp. in 1977. Its propeller diameter is 8 m and its output is 8 kw. The first Darrieus type windmill in Japan was also developed by the Japan Telephone and Telegraph Corp. in 1977. It has a maximum blade diameter of 8 m and output capacity of 2 kw.

A Giromill type experimental wind turbine was developed by the Iwanaka Electric Works Ltd. Another Giromill type windmill was developed by Mr. Seki's group of Tokai University which had an output of 30 W.

A prototype "Kaifu No. 1" with a twin rotor tilting type windmill was developed and field tested in 1978.

Japan

A number of unique wind energy systems are being developed at various industrial firms and universities. Also large number of amateurs throughout Japan are trying to manufacture unique windmills with various devices.

Present study of wind energy systems comprise the following subjects :

1. Meteorological and environmental assessment.
2. Preparation of model for the determination of suitable site conditions.
3. Design of 300 MW output plant.
4. Design of experimental 3 MW component.

NETHERLANDS

In the middle of last century, there were 9000 windmills in Netherlands. At the moment about 900 windmills are left, but only very few are operational.

An estimate of the potentiality of wind energy in the Netherlands indicates that about 20% of the present day electricity production could be obtained from the winds.

In 1975, a Project Evaluation Group prepared a proposal for a research and development programme on wind energy. The Government decided to have this programme executed, starting on March 1976. In Netherlands, two research programmes are presently carried out in the field of wind energy :

- 1) A National Programme on Wind Energy : This is to investigate the possibilities of using wind energy as a source of power for the Netherlands.
- 2) A Programme on Wind Energy for Developing Countries : This is community study on possible use of wind energy in rural areas of developing countries.

Current research programme includes detailed meteorological studies in the North Sea as well as analysis of weather data from measurements from the coastal regions.

A 5 m diameter Darrieus wind turbine was designed, constructed and put into operation in 1977. The turbine located at Netherlands Aircraft Factories Fokker-VFW has an output of 1.8 kw at 7 m/sec windspeed and 15 kw at 14 m/sec windspeed.

A new programme that was included in the national programme concerned the study of the effect of tip-vanes (small additional wings, mounted at the end of the rotor blades) on the efficiency of horizontal axis turbines.

Netherlands

At present official R&D policy concerning wind energy is focussed on very large systems, like rotors with a span of 50 meters. There are plans for "Wind turbines at the North east Coast and I. Jssellake. 5000 of these giant mills would be able to supply 10-15% of the country's current electricity demand. The next 5 years (1981-1986) of the National Research Programmes on Wind Energy will pay more attention to R&D with small 5-10 meter turbine. These will be used by the government to dewater the polders and by fruit growers to cool their products.

List of institutes and industries involved in the execution of the national research programme on wind energy :

* Institute of Industry	Research and Development Activities
KNMI (Royal Netherlands Meteorological Institute)	Determination of wind characteristics.
Fokker Aircraft	Operation of a vertical axis rotor wind turbine unit (rotordiameter 5 m). Development of economic fabrication methods for rotor blades.
NLR (National Aerospace Laboratory)	Development of computer programme for parametric investigations of the performance and aero-elastic behaviour of windturbine rotor systems.
FDO-Engineering Consultants B.V.	Design, fabrication and assembly of a medium scale horizontal axis wind-turbine. (rotordiameter 25 m).
Eindhoven University of Technology	Development of electric systems for the conversion of mechanical into electrical energy.
Smit Slikkerveer	Evaluation of electric systems for the conversion of mechanical energy into 50 cycle a. c. power to be fed into the utility grid.

Netherlands

Institute of Industry	Research and Development Activities
MT-TNO	Study on wake interactions of wind-turbine clusters.
Delft University of Technology	Investigation of the tip-vane concept.
Rijn-Schelde-Verolme	Study of wind turbines located off-shore.
Rademakers Aandrijvingen	Development of a epicyclic gear system for the conversion of a variable rotor speed to a constant generator speed.
KEMA (Utility board)	Integration of wind energy conversion system into the existing utility grid.
ECN (Netherlands Energy Research Foundation)	Project Management. Evaluation of programme results. Literature research and documentation.

Contact : H. Wolzak, Secretary.

Activities :

Wind energy activities began in 1973.
Mainly engaged in disseminating information
about wind energy.

Funding Source :

From the retribution for the information given.

Publications :

Books, monographs, technical reports, research papers. ('Windmill De Traanroeier Oudeschild' (Texel), technical description of the horizontal axis windmill for the island with capacity of 50 kw is available).

NEW ZEALAND

Renewable resource alternatives, wind generated electricity appears to offer a worthwhile contribution in the short term. New Zealand is situated in a strong wind belt and has a wind power potential ranked amongst the highest in the world.

The total resource is estimated as equivalent to 25,000-100,000 GWh, depending on land use in areas having wind-speed exceeding 7 m/s. A 65 m diameter machine rated at 1 MW would give an output of approximately 4.5×10^6 KWh/yr at a site with an annual mean windspeed of 7 m/s. It is estimated that there are sufficient such sites in New Zealand to accommodate at least 5000 machines. However, the inadequacy of experience with the commercial availability of suitable machines would make large scale implementation before 1985 difficult, though a number of demonstration pilot schemes are planned.

The Meteorological Office is monitoring wind velocities but environmental/visual factors must also be assessed. Even 450 of the machines mentioned above could generate upto 10% of the present annual electricity needs.

New Zealand contains many potentially attractive wind power sites and yet in mainly such areas of complex terrain there are "meteorological data" deserts. One such area is the Rakaia River Gorge region on the eastern slope of the Southern Alps in New Zealand. Local farmers and fishermen speak of incredible winds in the gorge canyon. Hence a survey programme was proposed to utilize laboratory simulation of the relevant wind characteristics in a meteorological wind tunnel. To evaluate the validity of lab simulation methods and provide a confidence measurement bound for laboratory data, a simultaneous limited field measurement programme was organized.

NIGERIA

Very little work has been done in this line, although some simple easy-to-build windmills have been designed and tested. In one design, a Savonius Rotor Windmill was made up of two 44-gallon petrol drums and was coupled to a locally-made diaphragm pump. The unit worked well and was able to pump water effectively. Another design built and tested was a vertical axis turbine-type rotor with sheet-steel blades. This unit gave better results than the Savonius rotor unit.

The Northern areas of Nigeria are among the more windy areas and hence, being rather remote, could benefit from the introduction of these windmills. It is noted that the propeller-type windmills have been in use as pump prime-movers in some coastal towns of Nigeria for years and are still functioning.

The Federal Ministry of Mines and Power has been charged with the development of the new sources of energy. Various bodies, particularly universities have been carrying out basic R&D work on some aspects of wind and solar energy. Financial support has been rather small and results have been rather modest.

PAKISTAN

Wind power as an alternate source of energy is being introduced in the country after the successful installation of a few windmills for water lifting at various places along the coastal areas of Sind and Baluchistan provinces.

The Energy Resource Development (E.R.D.) of Pakistan's Ministry of Petroleum and Natural Resources with the United Nations Development Program granted for 4 additional energy centers in Pakistan at an estimated cost of \$1.8 m. An integrated system of shore wind, biogas and solar energy will be developed and power will be combined in a small energy bank to meet the requirements of lighting, irrigation and small agricultural units such as flour mills. The E.R.D. is also in process of establishing 16 rural energy centers using wind, biogas, solar and geothermal energy.

On request of the Appropriate Technology Development, Mr. M. Futehally in Karachi started to repair 6 existing Australian water pumping windmills a few years ago. After their successful installation on farm 6 extra 3.6 m windmills were built, simply by copying the Australian designs. Also a 7.6 m Southern Cross was copied. After visits of SWD (Steering Committee on Wind Energy Developing Countries) advisors, Mr. Futehally became interested in building the 8 bladed, 3 m rotor windmill, developed by the Wind Energy Unit in Sri Lanka. The windmill was erected in 1978 (in windspeeds of 6 m/s the output was 50 litres/minute).

Thus Mr. Futehally of Merin Ltd., Karachi, who are the main fabricators of windmills in Pakistan, have entered in collaboration with ITDG in the joint venture for the development of a low-cost windmill with greater efficiency.

SENEGAL

Research papers (1. A Statistical Methodology for Study of Wind Characteristics from a Close Array of Stations (1979). 2. A Study on the Use of Windmills in Singapore, 1976).

Windmill Installations :

Laboratory scale horizontal axis windmill.

Personnel :

Dr. G.K. Nathan, and Dr. T.N. Goh.

SRI LANKA

The Wind Energy Utilization Programme of the Sri Lanka Government started in 1977, with assistance from the Government of Netherlands. In the past two and half years the Wind Energy Unit (WEU) of the Water Resource Board, responsible for the implementation of the programs has developed two prototypes of windmill water pump system (WEU I/2 3 m diameter and WEU II/2 5 m diameter). At the same time, a strong organization has been built up and windmill know-how has been transferred from Holland to Sri Lanka.

A separate section has been formed within the Wind Energy Unit (WEU), for pilot project study. A research proposal has been prepared to outline the general set-up of the studies at the pilot projects. The period of the study covers 1980 and 1981. In these 2 years, the possible constraints to a successful introduction of windmills to small farmers will be studied, including mechanical, agricultural, water management and socio economic aspects. 15 sites have been selected as pilot project sites.

The Government has decided to make available a sum of Rs. 7, 500/- per windmill WEU I/2 as a capital grant for 110 windmills. In each of the 11 Dry Zone Districts, 10 farmers will be selected through the Government Agent.

The results from the pilot projects, the 110 windmills through the Government and private, will make clear whether there is a sound future for the windmills in Sri Lanka.

The WEU also intends to examine the question of electricity generation with windmills and the attractivity for Sri Lanka or at least for specific areas and purposes.

Models WEU I/2 : 3 m rotor diameter.
WEU II/2 : 5 m rotor diameter.

Personnel :

6 Engineers, 3 Agricultural Officers and others.
Workshop consists of 5 mechanical and 8 labourers.

SWEDEN

In 1975, the National Swedish Board for Energy Source Development (NE - Namnden for Energiproduktionsforskning) was set up to establish, support and evaluate research and development into new energy sources. NE has taken over the responsibility for the Wind Energy Program which was initiated in 1973 by the National Swedish Board for Technical Development (STU) and to some extent, by the Swedish State Power Board (Vattenfall).

Sweden is situated within a belt of strong westerly winds. The windiest area, amounting to a total of 12,000 sq. km, are characterised by medium windspeeds of at least 7 m/s at 100 m above ground. A detailed siting analysis found that part of this high wind region could accommodate about 11,120 wind generator, with blade diameter 50 m, which would generate a total of about 20 TWh during a normal year. Current thinking favours a smaller number (3,300) of large units (100 m diameter) which would produce a large quantity of energy, 32 TWh/year.

In 1974, the Swedish State Power Board estimated that up to 12.5 TWh/year of wind generated electrical energy (corresponding to 5 GW rated power) could be accommodated within the existing electricity grid system. It is predicted that by 1990 the Wind Energy Conversion System installations visualised would be capable of providing approximately 10% of the national demand.

Over the period 1975-78, the Swedish government has spent 20 m SKr (\$4 m) on wind power. This has provided for wind energy prospecting, wind generator design study, systems analysis and the construction of an experimental unit, the 63 kw rated wind generator built by Saab-Scania at Alvkärlaby.

Over the three years starting with fiscal 1978/79, the Swedish government is providing 105 m SKr (\$21 m) for wind power. Part of this will cover the design and construction of two or three prototype units, each rated in the 1-2 MW range.

Of the 5000 km² of offshore area of less than 30 m water depth around Sweden's Coastline, 3300 km² line is in good wind energy area. In addition, the position of a wind turbine offshore can increase its specific energy output by 40% and its environmental impact could be reduced. Present day study seeks to

Sweden

exploit with design for horizontal and vertical axis turbines of 7 to 14 MW which could be constructed in commercial shipyards and towed to their locations, study by SIKOM AB and FFA, The Aeronautical Research Institute of Sweden.

TANZANIA

The institutions working on windmill programme in Tanzania are mainly the Ministry for Water, Power and Minerals (MAJI) with its workshops in Dar-Es-Salaam, Dodoma, Arusha, Shinyanga, Singida, etc., the University of Dar-Es-Salaam with its Faculty of Agriculture in Morogovo and the Faculty of Engineering in Dar-Es-Salaam, and institutions like Appropriate Technology Development Unit in Arusha, or TAMTU (Tanganyika Agricultural Machinery Testing Unit) also in Arusha. The Tanzania National Scientific Research Council, through its Solar Energy Promotion Committee tries to gather information on all ongoing projects in Tanzania and promote new projects.

Experience with conventional windmills for water pumping indicate strong and consistent winds during most time of the year in several regions in Tanzania. Most of the present windmills are for water pumping and imported. One of the design sponsored by MAJI is the so called Arusha Windmill (also known as VITA - Tanzania type) around 10 of them were built during the last 2 years. The MAJI windmill programme, according to a statement of the Minister of Water, Power and Mineral included also the installation of 130 windmills and pumps in a three year project assisted by Australia. In Manyani district, seven windmills of 5 m diameter and of Italian make were installed. Three Dutch students built a windmill for domestic water supply in village Kiguru-Kiro. Local efforts are also reported from Musoma area and from a Naivoli village.

Several very specific projects, both for water pumping windmills and for wind-driven generators are proposed, the most important one being a village power station of 45 kw based on wind power.

TURKEY

In almost 10-20% of the settlement centres of Turkey, the possibility of making use of the wind power exists. The utilization of wind power was not seriously investigated until recently. Although the importance of the wind power in the electricity generation was not fully recognized, still in some settlement centres it is used, though very primitively.

Large scale utilization of wind power under circumstances prevailing in Turkey cannot be considered economic as the country's potential in this respect is relatively small. Seasonal winds, velocities highly variable, are recorded in the country, but the wind period per hour is very low. Plans, are made to utilize this energy source in the rural areas.

Wind-operated machines may be successfully employed in the operation of water pumps and direct current generators used in the generation of electricity. Although several types, may be used to this effect, those operating at less than KW power are considered feasible and economic particularly for the agricultural purposes. Although very limited in use, examples of this type of application can be found in some settlement centres, being mainly employed in the water wells. Plans are made to increase the number of the developed and improved wind-operated power machines and to use these throughout the country.

U.K.

Wind energy research has attracted some interest from the electricity authorities as it has been suggested that wind generators could provide some 20% of Britain's requirements as firm power and in 1979-80, £450,000 was to be spent on wind energy research.

Investigations have shown that the western seaboard and the islands of the British Isles were capable of supplying wind-generated electrical plants with both available and consistent winds.

The overall aim of the U.K.'s R&D programme is to establish the feasibility of both land and offshore sited aero-generators. The U.K. collaborative program, founded by the Department of Energy and supervised by the Central Electricity Research Laboratories, five different designs of wind turbine of similar size are to be built by different groups.

Of the two horizontal-axis wind turbines, one is a 17 m diameter fixed-pitch machine built as a private venture by Sir Henry Lawson Tancred & Co. The other HAWT is a variable pitch machine of 5 m diameter designed and built by Sussex University College. It is installed on Rhossili Down, one of the windiest regions of Britain.

Three vertical-axis wind turbines (VAWT) are to be tested. Newcastle University Energy Centre with Kingston Polytechnic are building a conventional 5 m diameter 5 kw Darrius 'egg beater'. Exter University Wind Power Unit is developing a 5 m diameter machine with vertical blades and cyclically-variable pitch controlled by a wind vane so that blade angle-of-attack is optimized with respect to direction. The third VAWT is a Musgrove type developed by P.I. Specialist Engineers Ltd.

In parallel with the official research, many independent centres are equally active. Low Energy Systems in Dublin has developed an interesting vertical axis machine of extreme simplicity. A simple and efficient low-cost horizontal axis windmill has been designed for easy construction in Third World countries by the Intermediate Technology Development Group together with the Energy

U.K.

Group of Reading University. For purely electrical applications, a permanent magnet alternator has been designed and built at Imperial College, London.

Operational experience on five types of wind machine, ranging from a multiblade 'Southern Cross' type pumping mill to an Elektro 5 kw horizontal machine and a DAF 3.2 kw vertical axis turbine, is being gained by the National Centre for Alternative Technology at Machynllete in Wales.

There are only some of the projects in progress, for wind energy research in the U.K. Interest, already strong, is increasing and it should not be long before a wide range of useful hardware is on the market.

1. Central Electricity Generating Board,
Planning Dept.,
20, Newgate St.,
London EC1;
U.K.

Telephone : 248-1202 Telegram : 'MEGAWATT LONDON EC1'
Tele : 883141

Contact : A.P. Rockingham, Hydro & New Energy Source Section.

Activities :

- First phase in wind energy lasted from 1950 to 1966.
Second phase commenced in 1975. Main activities are :
- 1) Collection of wind data on and off-shore at low and high altitude using masts and towers.
 - 2) Research using wind tunnel experiments and scale models.
 - 3) Field measurement of wind regime characteristics carried out on the 17 m diameter, 30 kw, horizontal axis wind generator at Aldborough.

Funding Source :

Internal.

Publications :

Research papers.

U.K.

Personnel :

About 10 men per year (increasing).

2. ERA Technology Ltd.,
Cleeve Road, Leatherhead,
Surrey KT22 7SA,
U.K.

Telephone : 03723 74151

Telex : 264045

Contact : Mr. B. Boss.

Activities :

Wind energy work commenced in 1948 and ERA is currently one of the largest independent research organizations of U.K. Several activities :

- 1) Site surveys conducted for over 100 hill sites in Great Britain and Ireland.
- 2) Economic and feasibility studies of using machines on island sites and studies of the export potential for large and small WTG's.
- 3) Designing and developing wind measuring instruments (developed the gust anemometer).
- 4) Development of three 100 kw machines. Designing of 60 m diameter, 3.7 MW WTG.
- 5) Advisory service : To the industrial group in U.K. and overseas utilities on wind power site selection.

Budget :

£5 M

3. Intermediate Technology Development
Group Ltd. (ITDG),
9, King Street,
London WC2E 8HN,
U.K.

Telephone : 01 836-9434

Telegram : 'IT DEV LONDON WC20'

Contact : Peter L. Fraenkel, Power Project Officer.

U. K.

Activities :

- 1) Development of wind pumps (begun in 1975) suitable for small scale economic manufactures.
- 2) Advisory Service : An ITDG subsidiary, Intermediate Technology Consultants Ltd. , assists governments and other agencies on the utilization of intermediate technologies in their development plan.
- 3) Testing prototype windmills in Botswana, Kenya, Egypt, Oman, Pakistan, Sri Lanka, Zambia and Antiqua.
- 4) Currently supporting a private entrepreneur with a design of a small wind powered battery charger (50 W).

Publications :

Variety of publications : Guides, bibliographies, specification of tools and equipments, manuals, special reports on field operations, industry profiles and a quarterly journal "Appropriate Technology."

Budget :

£10,000-£20,000 per annum.

Funding Source :

Christian Aid and Overseas Development Administration.

Windmill Installations :

Demonstration and actually functioning horizontal axis windmills for pumping water and power generation.

Low Energy System,
3, Larkfield Gardens,
Dublin 6,
Ireland.

Telephone : 01-96-0653

Contact : Brian Hurley, Director.

U. K.

Activities :

Work commenced in 1973.

Main activities are :

- 1) Wind data collection and evaluation.
- 2) Research and development : Successfully developed wind electric fence, vertical axis sail windmill (200 W output) and a trickle charger wind generator (for light bulb or a radio, 6V/12V system, 3-5 W output).
Currently engaged in wind power site analysis and wind system design.
- 3) Production and marketing.
- 4) Extension/promotion.
- 5) Policy formulation/programme evaluation.

Funding Source :

Private/Government.

Publications :

Books and monographs.

Windmill Installations :

Type of installation : Laboratory scale, demonstration models and actual use type.

Type of windmill : Vertical axis and horizontal axis.

Applications : Power generation and water pumpi

5. National Centre for Alternative Technology,
Llwyngwern Quarry,
Machynlleth Powys,
Wales.

Telephone : Machynlleth 2400.

Contact : Dr. Robert Todd.

Activities :

Wind energy work commenced in 1976.

Main activities :

- 1) Demonstration of different wind machines
(continuous monitoring programme).

U.K.

- 2) Future plans to include large electricity generating machines (30-60 ft diameter) and demonstration of new machines as they are brought out.

Budget :

£100,000 spent on wind energy programme.

Funding Source :

Occasional small donations and from gate admissions (charity).

Publications :

Do-it yourself plans (pumping and sail windmills), information sheets, technical reports (windmills at the Centre), visitors guide to the site and exhibits, resource sheets.

Windmill Installations :

Vertical Axis Windmills : DAF 3 kw in use for power generation.
Savonius - demonstration.

Horizontal Axis Windmills : (a) In use for power generation

Mullins - wind pumps
Cretan - D14
Electro - 5 kw
Winco - 200 kw
Dunlite - 2 kw

(b) Demonstration

Climax - wind pump
Sparko - wind pump
PIY - bicycle wheel

Personnel :

Dr. Robert Todd, Andrew P. Brown, Guy Watson and Roger White.

U.K.

6. University of Ulster,
Coleraine,
North Ireland.

Telephone : 0265-4141 Telegram : 'UNIVERSITY COLERAINE'

Contact : Dr. J.T. McMullan, Sr. Lecturer in Physics.

Activities :

Work initiated in 1975.

Specific activities :

1) Wind data collection and evaluation.

2) Policy formulation/programme evaluation.

Funding Source :

Internal.

Publications :

Research papers.

Personnel :

Mr. K. Wilson and Dr. R. Morgan.

7. Queens University of Belfast,
Dept. of Engg. Mathematics,
Belfast BT95AH,
North Ireland.

Telephone : 66111

Contact : Dr. D. Sprevak, Lecturer.

Activities :

Wind energy work commenced in 1979.

Main activities :

1) Wind data collection and evaluation.

2) Wind research.

Funding Source :

Queen's University.

U.K.

Publications :

Research papers ('A Comment on Fitting Stochastic Models to Wind Data' (1979); 'The Probability Distribution of Wind Velocity and Direction' (1979)).

Personnel :

Dr. D. Sprevak and Mr. B. McWilliam.

8. Trinity College,
Statistics & Operations Research Lab.,
Dublin 2,
Ireland.

Telephone : 772941 Telex : 31166 TCD EI

Contact : Prof. F.G. Foster.
T. Gibbons, Manager of Lab.

Activities :

- 1) Systems analysis particularly with respect to integration into electricity network.
- 2) Future plans to conduct time series analysis of meteorological data obtained from dispersed sites.

Budget :

£10,000 per annum.

Funding Source :

Irish Government; National Board for Science and Technology.

Publications :

2 technical reports and 3 research papers.

Personnel :

1 full time, 2 part time.

U.K.

9. University College,
Dept. of Mechanical Engg.,
Torrington Place,
London WC1E 7IE,
U.K.

Telephone : 01-387-7050

Contact : Dr. B.R. Clayton, Lecturer.

Activities :

Work commenced in 1975.

Primary research programme includes :

- 1) Study of wake shedding from models in an open jet wind tunnel.
- 2) Wake interaction of clusters of turbines.
- 3) Scale effect on performance.
- 4) Flow utilization studies around Darrieus and Savonius rotors.

Budget :

£10,000 for 1979-1981.

Funding Source :

Science Research Council.

Publications :

Research papers.

Windmill Installations :

Laboratory scale and demonstration models of horizontal and vertical axis windmills for power generation applications.

Personnel :

P. Filby, B.R. Clayton.

U.K.

10. University of Exeter,
Chemical Engng.,
EX4 80J,
U.K.

Activities :

Working on simple, low cost vertical axis
wind turbine since 1975.

Publications :

Technical reports and research papers
('Wind Energy Project (May 1977)' ; ' A Theoretical
and Experimental Investigation into the Variable
Pitch Vertical Axis Wind Turbine (1978)').

11. University of Reading,
Dept. of Engg.,
Energy Group, White Knight,
Reading RG6 2AY,
U.K.

Telephone : 851321

Contact : Prof. P.D. Dunn, Head of the Group.

Activities :

Wind energy work commenced in 1975.
Two separate programmes are underway :
1) The 'Large System Study' looking at wind
power integration into the national grid.
2) The 'Small (isolated) Systems Study' looking
at stand alone systems in the 10 kw to 1 mw
range (examples Scottish Island communities
or isolated (non-grid) situations anywhere in
the world.

Publications :

University of Reading programme summary; several
papers and reports on wind power integration studies.

Personnel :

Staff of 30 senior staff comprises of Prof. N.H.
Lipman, Dr. P.J. Musgrove and Dr. G. Rice.

U.S.A.

1. The Aerospace Corporation,
Energy & Resource Div.,
2350 E. El Segundo Blvd.,
El Segundo, CA. 91556,
U.S.A.

Telephone : 213-648-6154

Contact : Leon R. Bush, Wind Energy Conversion Systems
Project Manager.

Activities :

Work commenced in 1975.

- 1) Research and development : Performed several application studies which explore the economic, technical and operational issues in the practical application of large wind Turbine Generators (WTGs) to electrical utilities.
- 2) Wind data evaluation.
- 3) Policy formulation/programme evaluation.

Publications :

Programme summaries, project evaluation reports, technical reports.

Budget :

Variable.

Funding Source :

State and Federal Agencies.

Windmill Installations :

Studies are conducted on hypothetical horizontal axis windmills for applications like power generation

U.S.A.

2. * Aerowironment, Inc.,
145, Vista Avenue,
Pasadena, CA. 91107,
U.S.A.

Contact : Stel N. Walker, Peter Lissaman.

Activities :

- 1) Identify cost effective measurement systems for wind energy conversion sites.
- 2) Provide technical evaluation and economic assessment of augmented horizontal axis wind energy systems and high lift wind energy systems.
- 3) Determine performance and cost effectiveness of tip vane power augmentation.

Lead Agencies :

Pacific Northwest Laboratory, Richland; Solar Energy Research Institute, Colorado.

Funding Source :

U.S. DOE.

Publications :

Technical reports.

3. Alternative Energy Institute (AEI),
West Texas State University,
P.O. Box 248, Canyon, Texas 79016,
U.S.A.

Telephone : (806)-656-3904

Contact : Dr. Vaughn Nelson, Director.

Activities :

AEI was created in 1977 by W. Texas State University.
Activities are as under :

- 1) Data collection and evaluation.
- 2) Testing of wind energy conversion systems.
- 3) Teaching and training: 2 new courses offered for the University (a) Residence and Rural Systems, and (b) Wind Energy and Wind Turbines.

U.S.A.

- 4) Collection and distribution of information :
AEI maintains an information center with materials on wind energy resource and commercially available wind energy. Collection includes reports from NASA, Sandia, Battelle PNL, NTIS and DOE.

Publications :

Several technical reports and research papers on various topics of wind energy.

Budget :

\$120,000 per annum.

Funding Source : State of Texas.

Windmill Installations :

Currently testing 2 Vertical Axis Wind Turbine (DAF 4, DAF 40) and 3 Horizontal Axis Wind Turbine (Dakota, Winger, Carter) for applications like water pumping and power generation.

4. Alternate Energy Systems, Inc. ,
614 S. Cleveland St. ,
Oceanside, CA. 92054,
U.S.A.

Telephone : 1-714-722-5010

Contacts : William A. Lutes, Chairman.
Fredrick J. Carroll, Vice President.

Activities :

- Wind energy activities began in 1978.
1) Wind data collection and evaluation.
2) Production and marketing.
3) Extension/promotion.
4) Financing/supporting.

U.S.A.

Funding Sources :

Private/commercial.

Windmill Installations :

Type of installation : Actual use.

Type of windmill : Vertical axis and horizontal axis.

Application : Water pumping and power generation.

Additional Information :

William A. Lutes of the Alternate Energy Systems, Inc., has set up Wind Energy Unlimited, a cash-and-carry dealership for electricity generating windmills in San Diego Oceanside. Lute's dealership stocks 4 windmill models priced from \$600 to more than \$6,000 used for charging battery and pumping water from depth of 300 feet.

5. Alternative Sources of Energy, Inc., (ASE),
107, S. Central Ave.,
Milaca, MN. 56353,
U.S.A.

Telephone : 612 (983) - 68 92

Contact : Donald Marier, Editor.

Activities :

Wind energy work commenced in 1971.

Main activities are :

1) Extension/promotion.

- 2) Wind information : Maintains a library of 1,000 books, articles and journals. Offers bibliographic and information searches, as well as consulting services through its Energy Information and Referral Services.

Publications :

Publishes "Alternative Sources of Energy" (bi-monthly magazine) and "Energy Digest" (midwest newsletter).

U.S.A.

6 American Wind Energy Association (AWEA)

1609, Connecticut Ave., N.W.

Washington D.C. 20009,

U.S.A.

Telephone : (202) 667-9137

Contact : Mr. Benjamin Wolff, Executive Director.

Activities :

Main activity is publishing. Publishes information on research contracts, news releases, conference proceedings, and items of general interest. Sponsors two conferences each year which include presentations and exhibits. Provides Federal and State legislators with necessary information to make a reasonable assessment of wind as an energy source. AWEA brochure, contains membership and organizational information. It also contains information on the use of wind energy, siting, the economics of wind energy, wind energy publications, commercially available wind machines, wind machine distributors and the Federal Wind Energy Program.

Publications :

Two regular publications, the AWEA Windletter and the Wind Technology Journal.

Budget :

\$250,000 per annum.

7, Aluminium Company of America,

Alcoa Laboratories,

Alcoa Center, PA, 15069,

U.S.A.

Contact : Marvin Williams

Activities

Fabrication of low cost, vertical axis wind turbine.

U.S.A.

Lead Laboratory :

Sandia Laboratories, Albuquerque.

Funding Source :

U.S. Department of Energy (DOE).

8. * The Boeing Engineering and Construction Co.,
P.O. Box 3707,
Seattle, WA. 98124,
U.S.A.

Contact : W.H. Robbins, Jim Couch.

Activities :

MOD-2 Turbine Project : Designing, fabricating and testing three experimental 300 foot diameter wind turbines of the horizontal axis type with capacity 2.5 kw.

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

U.S. Department of Energy (DOE).

Cooperative Utility :

Bonneville Power Administration Portland,
Oregon.

9. Bonneville Power Administration,
P.O. Box 3621,
Portland, OR. 97208,
U.S.A.
Telephone : 503-234-3361

U.S.A.

Contact : Douglas Seeley (Person-in-charge MOD-2)
Steve Levy (Pilot Project)
Gene Tollefson, Public Information Officer

Activities :

Wind energy activities commenced around the year 1979-80.

Presently, there are 2 major programmes :

- 1) MOD-2 Turbine Project : Test of three-unit of 2500 kw Boeing MOD-2 wind turbines supplied and installed by the U.S. Department of Energy.
- 2) Pilot Project : 1) Loan of wind recording instrumentation through public utilities to individuals to assess the wind resource at 140 sites in the Pacific Northwest. 2) Site evaluation followed by erection of 13 small wind energy conversion systems from 1.5 kw to 4 kw at private residence. Homeowner option to purchase after 5 years.

Budget :

MOD-2 Project - FY 1981-\$180,000.
FY 1982-\$150,000.
Pilot Project - \$450,000.

Funding Source :

Bonneville Power Administration, self financed through power revenue from utility-customers.

Publications :

Public information booklets on both above programs. Reports will be generated in the beginning of 1981 on MOD-2; small wind energy booklet available 1981.

Windmill Installations :

MOD 2 Turbine : Three 2500 kw, upwind, two bladed, soft steel tube support, synchronous generator, pre-commercial units.

Pilot Project : 2 Enertech Corporation 1.5 kw small wind energy conversion systems.

U.S.A.

Personnel :

MOD 2 : D. Seely, R. Holeman, N. Butler.
Pilot Project : Steve Levy, Roy Reinhart.

10. * The BUDD Co.,
375, Commerce Drive,
Ft. Washington, PA. 19000
U.S.A.

Contact : W. Eggert.

Activities :

Developing low cost wind turbine blade fabrication methods. This task was initiated in 1978 and will continue till 1982. The efforts include full-scale (MOD-OA) blade design and fabrication phase.

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

U.S. Department of Energy (DOE).

11. California Energy Commission,
Wind Energy Programme,
1111 Howe Avenue, MS 66,
Sacramento, California 95825,
U.S.A.

Telephone : (916)-924-2496

Contact : Mr. Robert Thomas.

Activities :

Wind energy work commenced in 1977.

Main activities are :

- 1) Commercialization of large wind electric conversion systems.
- 2) Wind resource prospecting.

U.S.A.

- 3) Site verification.
- 4) Wind machine demonstration.

Budget :

About \$500,000 per annum.

Funding Source :

State of California.

Publications :

Several reports and research papers on wind energy assessment, wind resource potentials of California and its regions. Reports on environmental impact, large WES in California. ('California Wind Directory' (May 1980); 'Personnel and Organizations Involved in Wind Energy in California' (Feb. 1980)).

Personnel :

Staff of 11, four of them are student assistants.

12. Clarkson College,
Mechanical & Industrial Engg. Dept.,
Potsdam, N.Y. 13676,
U.S.A.

Telephone : 315-268-2321

Contact : Dr. Edward Kear, Chairman.

Activities :

- 1) Wind data collection and evaluation.
- 2) Research and development : Vertical Axis Wind Turbine (VAWT) Project.

Funding Source :

Industrial support.

Windmill Installations :

Demonstration units of horizontal and vertical axis windmills for applications like power generation.

U.S.A.

13. * Colorado State University,
Fort Collins,
CO. 80523,
U.S.A.

Contacts : R. Meroney (Dept. of Civil Engg.)
J.R. Gnnell (Dept. of Mech. Engg.)
Robert N. Meroney
Virgil A. Sandborn

Activities :

- 1) Wind tunnel model studies for wind power sites.
Selecting potential WECS sites in the Kahuku
area (Hawaii).
- 2) Development of wind-powered pump in a dairy
operation (a VAWT has been constructed and
connected to a milk cooling/water heating system
at the Colorado State University dairy farm).
- 3) Provide methods for measuring and analyzing
wind near a WECS for performance evaluation.

Lead Agency/Lab :

Pacific Northwest Lab., 'Ichland.
U.S. Dept. of Agriculture, Beltsville.

Funding Source :

U.S. Department of Energy (DOE).

14. * Cornell University,
Agricultural Engg. Dept.,
Ithaca, New York,
U.S.A.

Contact : W.W. Gunkel.

Activities :

- 1) Direct mechanical conversion to heat : A 12 ft
diameter, VAWT is being used to heat water near
Ithaca.

U.S.A.

Lead Agency :

U.S. Dept of Agriculture, Beltsville.

Funding Source :

DOE.

15. * Desert Research Institute,
P.O. Box 60220,
Reno, NV. 89506,
U.S.A.

Contact : Dr. Thomas Hoffer.

Activities :

Developing reference documents for estimating
atmospheric characteristics for Wind Energy
Conversion Systems (WECS) design.

Budget :

FY 1979 - \$19,000 (Wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Reports to be published on current estimates of
atmospheric characteristics for use in WECS
design. A report is planned to be published on
two icing types : freezing rain and rime-icing.

16. Development Planning & Research Association,
Post Office Box 727,
Manhattan, Kansas,
U.S.A.

Telephone : 913-539-3565

U.S.A.

Contact : John P. Wagner, Economist.

Activities :

- 1) Economical analysis : Agricultural wind energy applications.
- 2) Market research.

Lead Agency :

U. S. Dept. of Agriculture, Beltsville.

Funding Source :

DOE.

17. Division of Energy & Economic Development,
Div. of Energy & Power Development,
7th floor, MacKay Building,
338, Denali Street,
Anchorage, Alaska 99501,
U.S.A.
Telephone : 907-276-0508.

Contact : Donald R. Markle, Energy Project Manager

Activities :

- Wind energy work commenced in 1978.
Specific activities include :
- 1) Wind data collection and evaluation.
 - 2) Research and development.

Budget :

\$500,00 per annum.

Funding Source :

State of Alaska General Fund and Dept. of Energy,
Washington.

Windmill Installations :

Laboratory scale, demonstration units and functioning horizontal axis windmill for power generation. There are 50 systems installed in Alaska. Inter-tie system and stand-alone are being used for practical applications|

U.S.A.

18. Electric Power Research Institute (EPRI),
Communication Division,
Box 10412,
Palo Alto, CA. 94303,
U.S.A.

Telephone : (415) 855-2000 Telex : 910-373-1163

Contact : Frank R. Goodman, Jr. Project Manager.

Activities :

Wind energy work commenced in 1976.
EPRI selects, funds, and manages research
projects to develop new ways to produce, transmit
and distribute electric power. Other activities
include : (a) Wind turbine siting methodology,
(b) utility impact analyses, and (c) wind turbine
performance assessments.

Publications :

Programme summaries, technical reports.
Publishes 'EPRI Guide' which contains ordering
information and annotations for all EPRI research
project reports, reprints of 'EPRI Journal' fact
sheets and other miscellaneous printed items.

Budget :

\$262 million (total 1980 funding for all EPRI
research programmes).

Funding Source :

Approx. 640 member utilities throughout U.S.

19. Energy Resources Co., Inc.,
185, Alewife Brook Parkway,
Cambridge, Mass. 02138,
U.S.A.

Telephone : 617-661-3111 Telex : 710-320-0721

Contact : Dr. John B. Edwards, Vice President.

U.S.A.

Activities :

Wind energy work commenced in 1978.

Specific activities are :

- 1) Wind data collection and evaluation.
- 2) Extension/promotion.
- 3) Policy formulation/programme evaluation.
- 4) Financing/supporting.

Funding Source :

Internal/DOE.

Personnel :

John Edwards, Ron Beck, Richard Rosen,
David Myers.

20. Energy Utilization Systems, Inc., (EUS),
365, Plum Industrial Court,
Pittsburgh, Pennsylvania 15239,
U.S.A.

Telephone : 412-325-2820 Telex : TWX:510-468-5771

Contact : Robert L. Dunning, President.
Barry D. Sloane, Manager of Consulting.

Activities :

Wind energy work commenced in 1978.

Main activities are :

- 1) Wind data collection and evaluation.
- 2) Research and development : Providing
support for Demonstration VAWT/Electri Utility
Project.

Publications :

Reports of the above project to be published.

Budget :

\$20,000 for the wind energy project.

Funding Source :

National Rural Electric Cooperative Association
(NRECA).

U.S.A.

21. * Environmental Systems Corp.,
P.O. Box 2525,
Knoxville, TN. 37901,
U.S.A.

Contact : T.B. Carlson.

Activities :

Meteorological measurements at candidate sites and meteorological measurements at wind turbine sites.

Budget :

FY 1979 - \$686,000 (Wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Cassette wind data tapes collected at each site from which data reports are prepared.

22. * EMR Teremetry, Inc.,
P.O. Box 3041,
Sarasota, Florida 33578,
U.S.A.

Contact : Harold Neustadter.

Activities :

Acquiring, processing and analysing the engineering data generated during all wind turbine operations (including MOD-O in the near future) and to convert these data into useful information. This task began in 1976 and will continue till 1984.

U.S.A.

Budget :

FY 1979 - \$345,000 (wind energy project).

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

DOE.

23. * Flow Industries, Inc.,
21414 68th Avenue,
Kent, WA. 98031,
U.S.A.

Contact : James U. Riley.

Activities :

Studies on wind turbine wake flow.

Budget :

FY 1979 - \$29,000 (wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Plans to publish an annotated bibliography of significant papers related to wind machine wake effects.

U.S.A.

24. * FWG Associates, Inc.,
R.R. 3, Box 331,
Tullahoma, TN. 37388,
U.S.A.

Contact : Dr. Walter Frost.

Activities :

- 1) Study to characterize the effects of micro-scale terrain features on near surface wind (for selecting sites for WECS installations).
- 2) Performing error estimate calculations for a set of four wind characteristics reported in the NASA handbook for design of wind turbines.

Budget :

FY 1979 - \$51,000 (wind energy project).
FY 1979 - \$27,000.

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Technical reports, research papers. Plans to publish a handbook containing methods in selecting an optimum site for a WECS within a small area.

25. * General Electric Company,
P.O. Box 8661,
Philadelphia, PA. 19101,
U.S.A.

Contact : W.H. Robbins, John Collins.

U.S.A.

Activities :

Developing 2 MW, horizontal axis, propeller type experimental wind turbine generator with 2 rotor blades 200 feet in diameter (MOD-1 Project). Installed at Boone, North Carolina.

Budget :

FY 1979 - \$3,800,000 (wind energy project).

Lead Agency :

NASA Lewis Research Center.

Funding Source :

DOE.

Cooperating Utility :

Blue Ridge Electrical

Publications :

Reports (engineering and performance data of 2 MW wind turbine).

26. * GEOMET, Inc.,
Gaithersburg, MD. 20760,
U.S.A.

Contact : Ken Pickering.

Activities :

Produce regional assessment of wind data for Northeast Region of U.S.A.

Budget :

FY 1979 - \$90,000 (wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

- . x ' b -

U.S.A.

Funding Source :

DOE.

27. Georgia Institute of Technology,
School of Geophysical Sciences,
Atlanta, GA. 30332,
U.S.A.

Telephone : 404-894-3890

Contact : C.G. Justus.

Activities :

Work began in 1974.

Activities include :

Evaluating turbulence effects on wind turbine performance as well as monthly and annual variation in mean windspeed (the annual variability of wind power of 40 National Weather Service Stations with mean windspeed greater than 5 m/s has been studied).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Technical reports, research papers.

Windmill Installations :

Demonstration unit, horizontal axis windmill for power generation.

U.S.A.

28. * Global Weather Consultants,
San Jose,
CA. 95113,
U.S.A.

Contact : Richard L. Simon.

Activities :

Produce regional assessment of wind data for
Southwest Region of U.S.A.

Budget :

FY 1979 - \$56,000 (for wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

29. * Gougeon Brothers, Inc.,
705, Martin St.,
Bay City, MI. 48706,
U.S.A.

Contact : M. Gougeon.

Activities :

Developing low cost wind turbine blade fabrication
methods. The task was initiated in 1978 and will
continue till 1982. The first set of blades from
Gougeon Bros., was delivered in March 1980.

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

DOE.

U.S.A.

30. * Grumman Aerospace Corp.,
South Oyster Bay Road,
Bethpage, N.Y. 11714,
U.S.A.

Contacts : James T. Yen.
K.M. Foreman.

Activities :

- 1) Development and testing of Tornado Type Wind Energy System (TTWES).
- 2) Investigating Diffuser Augmented Wind Turbine (DAWT).

Lead Laboratory :

Solar Energy Research Institute, Colorado.

Funding Source :

DOE.

Publications :

Research papers and reports on above activities.

31. * Hibbitt & Karlsson,
North Scituate, RI. 02857,
U.S.A.

Contact : H.D. Hibbitt.

Activities :

Developing a computer capability for the prediction of stress, deflection and structural vibration of Darrieus Turbine.

Budget :

FY 1979 - \$48,500 (wind energy project).

Lead Laboratory :

Sandia Laboratories, Albuquerque.

U.S.A.

Funding Source :

DOE.

Publications :

Technical reports.

32. * IIT Research Institute,
10, West 35th Street,
Chicago, IL. 60616,
U.S.A.

Contact : K. Hofer.

Activities :

Developing low cost wind turbine blade fabrication methods. This task was initiated in 1978 and will continue till 1982. The effort included full-scale (MOD-OA) blade design and fabrication phases. A contract was also awarded to IITRI for fatigue testing to support the composite blades.

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

DOE.

33. International Wind Energy Institute,
Route 1, Box 93-A,
Oskaloosa, Kansas 66066,
U.S.A.

Telephone : 913-842-0298

Contact : Steve Blake.

Activities :

Work commenced in 1972.

Specific activities include :

U.S.A.

- 1) Wind data collection and evaluation.
- 2) Research and development.
- 3) Policy formulation/programme evaluation.
- 4) Financing/supporting.

Publications :

Books and monographs.

Funding Source :

Private donors; U.S. Dept. of Energy.

34. Iowa State University,
213, Davidson Hall.
Ames, IA. 50011,
U.S.A.

Telephone : 515-294-5723

Contact : Dr. L.H. Soderholm, Research Leader.

Activities :

Wind energy work began in 1974.

Main activities are :

- 1) Wind data collection and evaluation.
- 2) Research and development : Wind power for heating farm structures.
- 3) Demonstration of agricultural applications (sponsored 1979 Workshop on Wind Energy Applications in Agriculture).

Publications :

: Research papers. Conference Proceeding (Wind Energy Application in Agriculture USDA Wind Workshop Proceeding 1979).

Budget :

\$60,000 per annum.

Lead Agency :

Dept. of Agriculture.

U.S.A.

Funding Source :

DOE.

Windmill Installations :

Demonstration units and functioning horizontal axis windmills for agricultural tasks.

35. * JBF Scientific Corp.,
2, Jewel Drive,
Wilmington, MA. 01887,
U.S.A.

Contact : Theodore R. Korneich.

Activities :

Generic study of vortex extraction Wind Energy Systems.

Budget :

FY 1979 - \$24,950 (wind energy project).

Lead Laboratory :

Solar Energy Research Institute, Colorado.

Funding Source :

DOE.

Publications :

Technical reports.

36. * JDB & Co.,
1629, K. Street,
N.W. Suite 700,
Washington D.C. 20006,
U.S.A.

Contact : Thomas G. Bolle.

U.S.A.

Activities :

Market development of Small Wind Energy Conversion Systems.

Budget :

FY 1979 = \$800,000 (wind energy project).

Lead Laboratory :

Rockwell International, Colorado.

Funding Source :

DOE.

Publications :

Technical reports.

U.S.A.

Telephone : (415) 422-1800

Telex : (TWX-910-386-8339
UCLLL LVMR)

Activities :

- 1) Wind data collection and evaluation.
- 2) Research and development : Several studies have been made on wind power yield measurement conducted in conjunction with numerical analyses of regional wind energy. A computational site screening methodology for wind energy has been developed at Lawrence Livermore Laboratory.

Budget :

FY 1976 - \$70,000.

FY 1977 - \$236,000.

FY 1978 - \$240,000.

Funding Sources :

Energy Research and Development Administration/
Dept. of Energy.

U.S.A.

Personnel :

Staff of 11.

38. * Marlatt & Associates,
3611, Richmond Drive,
Ft. Collins, CO. 80521,
U.S.A.

Contact : W.E. Marlatt.

Activities :

Develop procedure for using National Fire
data to estimate wind energy in Forest Service
regions.

Budget :

FY 1979 - \$26,000 (for wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

39. Massachusetts Institute of Technology,
Dept. of Aeronautics & Astronautics,
Cambridge, MA. 02139,
U.S.A.

Telephone : (617)-253-3758

Contact : Prof. R.H. Miller.
Prof. J. Dugundji.

Activities :

Wind energy work began in 1975.

Main activity is :

Basic research into horizontal wind turbine
structural dynamics, aerodynamics and drive
train dynamics.

U.S.A.

Budget :

Approx. \$70,000/year.

Funding Sources :

National Science Foundation; NASA Lewis Research Center.

Publications :

More than 10 reports on aerodynamics, dynamic studies of horizontal axis wind turbines, wake analysis, etc.

Windmill Installations :

1 horizontal axis windmill model (3 ft. diameter) for demonstration and for vibration and aerodynamic performance investigations.

Personnel :

R.H. Miller, J. Dugundji, M. Martinez-Sanchez, J. Wendell, B. Liebst, A. Kamoulakos, A. Tanuwidjaja.

Activities :

The Navy recognized the potentials of wind power in 1974. Main activity is .
Navy utilization of Wind Energy Conversion Systems.
4 demonstration programmes using commercial wind turbine generators are currently in progress.

Publications :

Technical reports and research papers (Wind Generated Electric Power at Navy Bases).

Windmill Installations :

Demonstration units of horizontal and vertical axis windmills for power generation at the navy bases.

Personnel :

4 full-time persons.

44. The New Alchemy Institute,
237, Hatchville Road,
East Falmouth, MA. 02536,
U.S.A.

Contact : Gary Hirshberg, Wind & Education.
Joseph Seale, Wind & Solar Design.

Activities :

In the area of wind energy, following are the activities :

- 1) Development of a sail wing water pumping windmill being used for a wind powered

U.S.A.

aquaculture system.

- 2) Windmill design modelling: A computer based model to assist designers in picking the best match of gearing and load for any given system and wind regime.
- 3) Windmill refrigeration: An analysis of the feasibility of using a direct drive windmill to power refrigeration freezing and heating system, with no intermediate conversion to electricity is presently underway.

Publications :

Journal of the New Alchemists; The New Alchemy Newsletter, and The Book of the New Alchemists.

Funding Source :

Private contributions and membership fees (2500 members); U.S. Dept. of Energy (for wind energy project).

45. New Mexico Solar Energy Institute,
Box 3 SOL, Las Cruces,
New Mexico 88003,
U.S.A.

Telephone : 505-646-1846

Contact : Dr. Schoenmackers/Dr. Barnett.

General Information :

In 1977, the New Mexico State Legislature established the New Mexico Solar Energy Institute whose research activities include solar heating, cooling, photovoltaic demonstration, biomass and wind energy technologies

Activities :

- 1) Several Demonstration Projects.
- 2) Wind Resource Assessments.
- 3) Training and Workshops.
- 4) Information Dissemination.

Budget :

\$30,000 plus contracts.

U.S.A.

Funding Source :

State of New Mexico.

Publications :

Programme Summaries - 'The New Mexico Wind Energy Program' Aug. 1980. Technical reports, research papers, review/surveys, bibliographies, brochures and pamphlets on wind energy. Poster - 'Wind Energy in New Mexico.'

Windmill Installations :

Vertical Axis Windmills :

Demonstration unit -
power for farmhouse.

Horizontal Axis Windmills :

Demonstration unit -
power for irrigation
and electrical heating.

Demonstration unit -
Utility interconnected.

Demonstration unit -
power for highway rest
stop.

46. New Mexico State University,
Physical Science Lab.,

Telephone : 505/522-2785

Contact : Ralph D. Reynold, Meteorologist.
Kenneth M. Barnett.

Activities :

Wind energy work commenced in 1976.

Specific activities include :

- 1) Wind data collection and evaluation.
- 2) Research and development : Identify cost effective measurement systems for Wind Energy Conversion sites.

U.S.A.

Budget :

\$50,000 per annum.

Funding Source :

State of New Mexico - Dept. of Energy & Minerals,
Pacific Northwest Laboratory/DOE (for wind energy
project).

Publications :

Technical reports.

Windmill Installations :

Demonstration unit of horizontal axis windmill.

47. * NOAA,
Technical Development Lab.,
National Weather Service,
Silver Spring, MD. 20910,
U.S.A.

Contact : Dave Gilhausen.

Activities :

Examining reliability of deterministic and
probabilistic wind forecasts.

Budget :

FY 1979 - \$40,000 (wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory.

Funding Source :

DOE.

U.S.A.

48. * North American Weather Consultants,
Goleta, CA. 93017,
U.S.A.

Contact : M.W. Edelstein.

Activities :

Obtain quantitative estimates of long-term wind
data-sparse areas.

Budget :

FY 1979 - \$10,000 (for wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

Technical reports.

Civil Engg. Dept.,
Evanston, IL. 60201,
U.S.A.

Telephone : 312-492-3453

Contact : Prof. Ross B. Corotis.

Activities :

Work began in 1976 to develop stochastic and
probabilistic methods for evaluating wind
characteristics at potential wind turbine sites.

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

U.S.A.

Publications :

Several technical reports and research papers on various wind characteristics.

50. Oklahoma State University,
School of Electrical Engg.,
Engg. Energy Lab.,
202, Engineering South/216, Engg. South,
Stillwater, OK. 74078,
U.S.A.

Telephone : 405 624 5170
5151
5157

Contact : Dr. R. Ramkumar or Dr. William L. Hughes

Activities :

Work began in 1960.

- 1) Past work includes development of special generator systems and electrolysis cells (for energy storage) for wind energy conversion systems; development and testing of bicycle-wheel type wind turbines; modelling and stability studies.
- 2) At present, work is primarily concentrated in modelling and information dissemination areas. Special emphasis is being given to developing country applications.

Budget :

Nearly U.S. \$600,000 during the past 20 years of which \$400,000 was spent during 1973-77.

Funding Sources :

Area utility companies; National Science Foundation, Washington D.C.; U.S. Dept. of Energy; State of Oklahoma.

Publications :

Technical reports and research papers on various topics of wind energy, review/surveys.

U.S.A.

Windmill Installation :

Horizontal Axis Windmills : During 1973-77, there were two turbines - 15ft diameter and 30 ft diameter turbine of the bicycle-wheel type, driving field modulated generators and operating in the variable-speed mode to maintain a constant tip speed ratio. They were operated, data gathered and analyzed and the installation has been dismantled as the projects reached their proper concluding stages.

Personnel :

9 past and present (1 from New Zealand and 1 from Pakistan).

51. Oregon State University,
Corvallis, OR. 97331,
U.S.A.

1801 Page Mill Rd.,
Palo Alto, CA. 94304,
U.S.A.

Contact : Fred S. Ma

Activities :

Identifying the concerns and impacts of Small
Wind Energy Conversion Systems, interconnected
with utility systems.

U.S.A.

Budget :

FY 1979 - \$112,000.

Lead Laboratory :

Rockwell International, Colorado.

Funding Source :

DOE.

Publications :

Technical reports.

71. * Tennessee Valley Authority,
345, Commerce Union Bank Bldg.,
Chattanooga, Tennessee 37401,
U.S.A.

Contact : D.W. Hilson.

Activities :

Analysis of operation of an electric power
system with and without wind generation.

Budget :

FY 1979 - \$198,000.

Funding Source :

DOE, Washington.

Publications :

Technical reports.

U.S.A.

72. * Tetra-Tech, Inc.,
911, Fort Myer Dr.,
Suite 601,
Arlington, VA. 22206,
U.S.A.

Contact : W. Garling, Mark Harper.

Activities :

- 1) Economic analysis of wind-powered grain (crop) drying system.
- 2) Generic study of augmented vertical-axis wind energy systems.

Funding Source :

DOE.

Leading Agency/Lab. :

U.S. Dept. of Agriculture, Beltsville; Solar Energy Research Institute.

Publications :

Technical reports.

73. * Texas Technology University,
Dept. of Mechanical Engg.,
Lubbock, TX. 79409,
U.S.A.

Contact : J.H. Strickland.

Activities :

Developing a theoretical aerodynamic model to predict experimental results for Darrieus wind turbine. A computer code has been developed for the simulation of turbine blades and wakes by time dependent vortices.

Budget :

FY 1979 - \$39,890 (wind energy project).

U.S.A.

Lead Laboratory

Sandia Laboratories, Albuquerque.

Funding Source :

DOE.

Publications :

Technical reports.

74. U.S. Atmospheric Sciences Laboratory,
White Sand Missile Range (W.S.M.R.),
NM. 88002,
U.S.A.

Telephone : 505-678-1227

Contact : Dr. Henry Rachele, Dy. Director, ASL.

Activities :

Wind energy work commenced around 1978-79.

Main activities are :

- 1) Assisting other agencies to determine feasibility of wind-generated power at White Sand Missile Range.
- 2) Wind measurement (turbulence, wind speed, wind direction) using atmospheric wind flow models.

Publications :

Programme summaries (feasibility of wind/solar energy for WSMR).

Funding :

U.S. Army.

Windmill Installations :

Type of windmill : Horizontal axis, UVW's, remote sensors (LDV's rawinsondes).

Applications : Alternate electricity source and water pumping.

U.S.A.

75. U.S. Department of Agriculture,
Agricultural Research Services,
Beltsville, MD. 20705,
U.S.A.

Contact :

Publications :

Information Desk, USDA,
Room 100W,
14th Independence,
Washington D.C. 20250.

Technical Information

Louis Liljedahl
202-447-3504

Activities :

- 1) Manages projects to identify design and performance requirements for farm and agricultural use of wind systems.
- 2) The main objectives are to determine promising agricultural applications of wind energy, define agricultural mark for wind systems and specify research and development projects which could lead to increased use of wind systems in the agricultural sectors.
- 3) The six USDA field experiments which form a part of the Proof of Concept Field Program are
(a) Wind Powered Farmhouse Heating. (b) Apple Storage Cooling. (c) Low-Lift Irrigation Pumping. (d) High-Lift Irrigation Pumping. (e) Dairy Milk Cooling and (f) Direct Mechanical Conversion to Heat.

Budget :

U.S. Dept. of Energy (DQE).

Contact : R. Nolan Clark.

Activities :

Research and development.

Publications :

Technical reports.

Budget :

\$150,000 per annum.

Funding Sources :

U.S. Department of Agriculture and U.S.
Department of Energy.

Windmill Installations :

Vertical axis and horizontal axis windmill for
water pumping and power generation.

77. U.S. Department of Agriculture,
Wind Energy Research Unit,
Room 204, Waters Hall,
Kansas State University,
Manhattan, Kansas 66506,
U.S.A.

Contact : L. J. Hagen.

Activities :

Work commenced in 1977.

Specific activities include :

- 1) Wind data collection and evaluation.
- 2) Research and development : Darrieus
applications.

Publications :

Technical reports and research papers ('Application
of Wind Energy to Greater Plains Irrigation Pumping'
(1980)).

U.S.A.

<u>Organization</u>	<u>Activity</u>
Idia Laboratories Albuquerque, New Mexico	Development of vertical axis wind turbine technology.

Budget :

\$87 m per annum.

Additional Information :

For DOE supported projects refer 'Wind Energy
Systems Program Summary' May 1980.

79. United Technologies Research Center,
Silver Lane,
East Hartford, CT. 06106,
U.S.A.

Telephone : 203-727-7536

Contact : Marvin C. Cheney, Program Manager.

Activities :

- 1) Research and development: Oscillating vane
concept applied to wind energy conversion.
- 2) Development of a 8 kw and a 15 kw Wind
Turbine Generator.

Funding Source :

U.S. Department of Energy.

Publications :

Research papers, reports reviewing 8 kw system.
Documentation and detailed drawings of 8 kw and
15 kw systems.

U.S.A.

Windmill Installations :

Demonstration units of vertical axis windmill
for water pumping application.

78. U.S. Department of Energy (DOE),
Asst. Secretary for Conservation & Solar
Energy,
Office of Solar Power Applications,
The Wind Energy Systems Branch,
Washington D.C. 20585,
U.S.A.
Telephone : 202-376-4878

Contact : Louis V. Divone, Director.

Activities :-

The main objectives of the U.S. Federal Wind
Energy Program are :

- 1) To accelerate the development of reliable
and economically viable wind energy systems.
- 2) To assure the earliest possible commercializa-
tion of wind power.

Responsibility for various aspects of the program
within the federal structure is divided as follows :

Organization	Activity
Solar Energy Research Institute, Golden, Colorado	Economic, institutional, environ- market analysis, innovative and research and information dissem
U.S. Department of Agriculture Beltsville, Maryland	Agricultural, rural and remote of small wind systems.
NASA Lewis Research Center Cleveland, Ohio	Development of intermediate and scale wind systems and support
Rocky Flats Plant Golden, Colorado	Development and testing of small systems and supporting studies.
Pacific Northwest Laboratory Richland, Washington	Wind resource research, site e and wind characteristics support design and operations.

U.S.A.

Windmill Specifications :

Electricity generating horizontal axis windmill.

	<u>15 kw</u>
Rotor diameter	14.6 m
No. of blades	2
Blade material	E-glass/epoxy
Shipping weight	1452 kg
Cut-in-wind speed	3.8 mt/sec
Cut-off-wind speed	35.8 mt/sec
Power output at a mt/sec	15 kw
Generator	Induction type
Tower height	50 ft
Tower weight	906 kg

80. * University of Alaska,
Arctic Environmental Information &
Data Center,
707 A Street,
Anchorage, AK 88501,
U.S.A.

Activities :

Provides analytical support services to the NASA Wind Energy Project Office analytical group to enable them to carry out their supporting analysis (aeroelastic stability analysis services).

Budget :

FY 1979 - \$133,000 (wind energy project).

Lead Agency :

NASA Lewis Research Center, Cleveland.

Funding Source :

DOE.

Publications :

Technical reports.

U.S.A.

91. * University of Virginia,
Charlottesville, VA. 22903,
U.S.A.

Contact : Michael Garstang.

Activities :

Work began in 1976, with a program to study the wind power potential of the U.S. East Coast and Gulf Coast regions (from Maine to Texas).

Budget :

FY 1979 - \$95,000 (for wind energy project).

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

Publications :

A report on the 1979 year's activity has been submitted.

92. * University of Wyoming,
Laramie, WY. 82071,
U.S.A.

Contact : R.W. Marrs.

Activities :

Wind characteristic study began in 1976.
Determine the feasibility of identifying high wind sites from satellite imagery.

Lead Laboratory :

Pacific Northwest Laboratory, Richland.

Funding Source :

DOE.

U.S.A.

Publications :

A handbook has been prepared which describes procedures for interpreting wind characteristics from aeolian features.

03. Virginia Polytechnic Institute,
P. O. Box 60220,
Blackburg, VA. 24061,
U.S.A.

Contact : Dr. Joseph A. Schetz (Dept. of Aerospace &
Ocean Engg.).

Activities :

Wind energy work commenced in 1975.

Main activities are :

- 1) R&D on aerodynamics, dynamics, structures and economics.
- 2) Developing reference documents for estimating atmospheric characteristics for WECS design.
- 3) Provide information on the practicality of using wind power for apple storage cooling (a 6kw wind turbine was installed for this purpose).

Budget :

\$50,000 per annum.

Funding Source :

U.S. Dept. of Agriculture, Virginia.

Publications :

Technical reports, research papers.

Windmill Installations :

Full-scale and lab-models.

Personnel :

Dr. W.O'Brien, Dr. D. Vaughan, Dr. K. Sundkuist.

U.S.A.

94. Volunteers in Technical Assistance,

Telephone : 301-277-7000

Telegram : VITA INC

Telex : 440192 VITA U1

Contact : Henry Norman, Executive Director.

Alan Wyatt, Associate Technical Advisor.

Activities :

Work began in 1959.

Activities are :

- 1) Information dissemination to requestors world-wide (by mail).
- 2) On site consulting - worldwide.
- 3) Small grant funding of wind energy and other projects worldwide.
- 4) Publication of technical manuals.
- 5) Development of 2 prototype windmills - with Instituto de Investigaciones Electricas (IIE) in Cuernavaca, Mexico.
- 6) In future, work envisaged, is, completion of design of prototype mills, testing, evaluation and possible licensing for production and marketing.

Funding Source :

U.S. Agency for International Development; U.S. Corporations (General Electric) and others.

Publications :

Books and monographs, technical reports, drawing, construction manuals of prototypes. Brochures on VITA documentation services, consultancy services, projects supported and volunteer opportunities.

Windmill Installations :

Horizontal axis windmill : In cooperation with IIE, Cuernavaca Mexico 2 windmills are being developed :
1 sail wing water pumping windmill (design stage), 3 sails, 10 m diameter, rated to pump

U.S.A.

60 US gallons/min at windspeeds of 12 mph, uses a variable stroke mechanism, uses brass piston pump for a deep well.
1 electric windmill (in initial design stage), capacity 10-12 kw

Personnel :

1 full time (Alan Wyatt) and 3 part time.

95. * Washington University Technology
Association,
Dept. of Mechanical Engg.,
St. Louis, MO. 63130,
U.S.A.

Contact : K.H. Hohenemser.

Activities :

Generic study of sail wing wind energy systems.

Budget :

FY 1979 - \$22,500 (wind energy project).

Lead Laboratory :

Solar Energy Research Institute, Colorado.

Funding Source :

DOE.

Publications :

Technical reports.

U.S.A.

Windmill Installations :

Demonstration units of horizontal axis windmill for power generation application.

COMMERCIAL MANUFACTURERS

- instruments
- wind electric generators
- water pumping windmills
- subsystem & components
(blades, towers).

INSTRUMENTS

1. * Belfort Instrument Co.,
1600 S Clinton Street,
Baltimore, Maryland 21224,
U.S.A.

Telephone : 301-342-2626

Cable : BELF

Contact : J. B. Reilly, President.

Products Manufactured :

Wind transmitters, wind indicators, recorders,
wind alarm, anemometer, wind measuring
sets.

Publications :

A catalogue of Belfort Instrument Co., which
contains complete technical information like
specifications, ordering information, detailed
drawings and catalogue number of the product.
Also a Domestic Price List is available.

2. * Climent Instruments Co.,
1320, West Colton Avenue,
Redlands, CA. 92373,
U.S.A.

Products Manufactured :

Wind direction indicators, anemometers.

Instruments

3. * Dwyer Instruments, Inc.,
Jet Ind. 212 & US 12,
Michigan City, IN. 46360,
U.S.A.

Products :

Anemometers, wind direction indicator.

4. * Elgar Corporation,
8225 Mercury Court,
San Diego, CA. 92111,
U.S.A.

Products :

Utility interface/inverters.

5. * Georator Corp.,
P.O. Box 70,
9617 Center St.,
Manassas, Virginia 22110,
U.S.A.

Products :

Brushless permanent magnet alternator.

6. * Hy-Cal Engineering,
12105 Los Nietos Road,
Santa Fe Springs, CA. 90670,
U.S.A.

Products :

Anemometers.

Instruments

7. * Kahl Scientific Instrument Corporation,
737, West Main Street,
El Cajon, CA. 92022,
U.S.A.

Products :

Anemometers.

8. Lund Enterprises, Inc.,
1180 Industrial Avenue,
Escondido, CA. 92925,
U.S.A.
Telephone : 714-746-1211

Product :

WINDFLOWER Windcomputer.

Publication :

Brochure with product information.

Product Description :

Windflower Windcomputer computes the production of a windgenerator at any given length of time. It works with batteries charged by sunlight. It also functions as an anemometer.

9. * M. C. Stewart Co.,
Crosby Road,
Ashburnham, MA. 01430,
U.S.A.

Products :

Anemometers, data aquisition systems.

Instruments

- 10.* Meteorology Research, Inc.,
464, West Woodbury Road,
Altadena, CA. 91001,
U.S.A.

Products :

Anemometers, wind direction indicator, data
acquisition systems.

11. Natural Power, Inc.,
Fracestown Turnpike,
New Boston, New Hampshire 03070,
U.S.A.

Telephone : 603-487-5512 Telex : Jastern Jenk #845233

Contact : Richard Katzenberg, President.
Deborra A. Doscher, Export Marketing Coordinator.

Activities :

Founded in 1972, with current activities of designing,
manufacturing and marketing of products for the
renewable energy industry.

Products :

Several models of the following :

Wind Site Analysis Equipments :

Wind Data Accumalator, Wind Recording Instruments,
Real Time Data Logger (magnetic tape recorder),
Wind Speed Compiler.

Wind Energy Conversion Systems Instruments :

Controls, Alternators, Monitors.

Publications :

Current product catalogue (with detailed specifications
of each model); export product list.

Instruments

12.* R. M. Young Co.,

278, Barham Ave.,
Santa Rose, CA. 95402,
U.S.A.

Products :

Utility interface/inverter.

14.* Soleq Corp.,
5969, North Elston Ave.,
Chicago, IL. 60646,
U.S.A.

Products :

Utility interface/inverters.

15.* Teledyne Geotech,
3401 Shiloh Road,
Garland, TX. 75041,
U.S.A.

Products :

Anemometers, wind direction indicators.

Instruments

16.*Texas Electronics, Inc.,
5529 Redfield Street,
P.O. Box 7225,
Dallas, TX. 75235,
U.S.A.

Products :

Wind direction indicators, anemometers, data
aquisition systems.

17.*Weathertronics, Inc.,
2777 Del Monte St.,
West Sacramento, CA. 95691,
U.S.A.

Products :

Wind direction indicators, anemometers, data
aquisition systems.

18.*Winfred M. Berg, Inc.,
499, Ocean Ave.,
East Rockaway, Long Island,
N.Y. 11518,
U.S.A.

Products :

Wind machine, transmissions.

WIND ELECTRIC GENERATORS

- 1.* Aerolelectric Co.,
13517 Winter Lane.
Cresaptown, MD. 21502,
U.S.A.

Products :

Tri-blade, wind machines.

2. * AERO Power Systems,
2398 Fourth St.,
Berkeley, CA. 94710,
U.S.A.

Telephone : 415-848-2710

Products :

Small wind turbine generator systems; towers;
tri-blade wind machines; wind turbine blades.

Windmill Specifications :

Aero Power's Starlite (SL) wind power systems employ a high torque drive system to reduce noise, maintenance and cost. All units are fully automatic, upwind, horizontal axis machines with a centrifugally activated feathering hub and 10 ft or 12 ft propellers. The model SL 1000 is rated at 1 kw at 22 mph wind speed; the SL 1500 is rated at 1.5 kw in a 22 mph wind. System is available in 14 and 28 VD6 output. Aero Power also offers the SL 1500 utility interface system with 100 V AC output.

- 3.* All American Engg. Co.,
801, South Madison St.,
Wilmington, DE. 19899,
U.S.A.

Product :

Windmill systems

Wind Electric Generators

4. * Alstham-Neyrpictechniques des Fluides,
B.P. 75,
38041 Grenoble Cedex,
FRANCE.

Product :

Electricity generating windmill.

5. * Aidco Maine Corp.,
Orr's Island, ME. 04066,
U.S.A.

Products :

Wind turbine, generator systems.

6. * American Energy Alternatives,
P.O. Box 905,
Boulder, CO. 80302,
U.S.A.

Contact : John Sayler.

Products :

Multi-blades, wind machines.

7. * American Wind Turbine, Inc.,

Electricity generating windmill.

9. * Astral Wilcon,
P.O. Box 291,
Milbury, MA. 01527,
U.S.A.

Telephone : 617/86

Products :

Wind generator. Manufacture custom rotor
blades for other systems.

Windmill Specifications :

Model :	AW 10-B
Rotor diameter :	3 mt
No. of blades :	3
Governing :	Automatic pitch
Output :	10 kw
Generator :	3 phase brushless alternator, Synchronous inverter.
Tower :	40 feet

10.* Automatic Power, Inc.,
213, Hutcheson St.,
Houston, TX. 77023,
U.S.A.

Products :

Wind machine generators; dual blade wind machines;
towers; wind turbine blades.

Wind Electric Generators

11. .Bergey Windpower Co.,
2001 Priestley Ave.,
Norman, OK. 73069,
U.S.A.

Telephone : 405-364-4212

Contact : Karl Bergey, President.

Activities :

Designing and testing of wind power generators,
designing of both horizontal axis and vertical-
axis machines, application of aircraft design
experience to the wind power field.

Products :

Windpower generators, inverter.

Publications :

Brochures.

Windmill Specifications : (Electricity generating windmill)

Models :	BWC 650 and BWC 1000
Rotor diameter	2.6 mt
No. of blades	3
Blade material	all-metal
Survival windspeed :	120 miles per hour
Maximum output :	650 W, 1000 W
Generator : DC	12 V, 24 V, 36 V, 48 V, 120 V.

Special Features :

- 1) The BWC incorporates a low-speed permanent magnet alternator driven directly by the rotor.
- 2) The BWC POWERFLEXTm rotor system provides variable pitch performance.
- 3) AUTOFURLTm (tail) provides overspeed protection.
- 4) BWC EMS-4 controller is a complete battery management system.

14. Dakota Wind & Sun Ltd.,
P.O. Box 178,
Aberdeen, SD. 57401,
U.S.A.
Telephone : 605-229-0815

Publications :

'The Dakota Wind Book' published by Living Energy
Consultants Ltd., Colorado.

Products :

Small wind turbine generator systems (electricity
generating). Dakota Wind & Sun Ltd., are manu-
facturers of LYNNER Wind electric machines.

Specifications :

Type :	Horizontal axis, upwind.
Rotor diameter :	4.3 mt
No. of blades	3
Blade material :	Wood, epoxy paint.
Transmission ratio	270

Wind Electric Generators

Cut-in-wind speed :	3.5 mt/sec.
Cut-out-wind speed :	18 mt/sec.
Governing :	Centrifugal blade feathering
Maximum output at 12 m/s	4000 W
Generator	110 V, DC 3 phase alternator

Dakota's five models have output of
2.2, 4.5, 7.5, 15 and 200 kw.

18. Dansk Vindkraft Industri Aps,
Vendevej 6, Bureso,
DK-3550, Slangerup,
Denmark.

Telephone : 452-1834 39

Product :

Vertical axis Voight Schneider (Giromill).

Publications :

Specification brochure.

Windmill Specifications : Electricity Generating Giromill

Model :	DVI 15/2
No. of blades :	3
Blade material :	Aluminum
Rotor diameter :	9 mt
Governing :	Airbrakes activated by cen fugal forces.
Transmission :	Gear.
Generator :	AC alternator, 15 kw, 3 ph 380/220V.
Output at 15 mt/sec :	14.2 kw.
Tower :	Steel types.
Tower Height :	9.95 m or higher.

Wind Electric Generators

Telex : AA82893

Contact : I.L. Besly, General Manager.

Wind Electric Generators

Activities :

40 years experience in power generation. At present, the firm is a leading wind electric generator manufacturer of Australia. Main activities are research and development (wind-powered generating systems); production and marketing (wind driven generating equipments).

Publications :

Publicity brochures (specifications, illustrations) books and monographs, manual on 'Planning a wind powered generating system.'

Windmill Specifications:(Electricity generating windmill Horizontal axis, tri blade)

Model :	2000 W	5000 W
Rotor diameter :	2.7 mt	5.6 mt
No. of blades :	3	3
Blade material :	Stainless steel	Stainless steel
Cut-in-windspeed :	4.4 mt/sec	3 mt/sec
Cut-off-windspeed :	11 mt/sec	9.37 mt/sec
Transmission :	Gear	Gear
Transmission ratio :	5:1	5:1
Governing :	Automatically controlled by centrifugal governor.	
Power output :	2000 W	5000 W
Generator : DC	3 phase, brushless alternator	
Voltage output :	24, 32, 110V	110 V
Tower :	3 legged, steel braced, galvanic in various heights.	

Wind Electric Generators (Contd.)

19. Dyenergy Corp.,
P.O. Box #28,
1269 Union Ave.,
Laconia, N.H. 03246,
U.S.A.
Telephone : 603-524-8313

Person in-charge : Dick Masters, Production Manager.
Ed Mallett, Marketing Manager.

Activities :

Site analysis, research and development (under DOE program the first installation of a Dyenergy wind turbine will be in Brownsville, Texas), production and marketing of vertical axis wind turbines.

Products

Darrieus rotors; small wind turbine generator systems; utility interface/inverters; wind machine alternators; wind machine generators.

Publications :

Article in New Hampshire Times (V. 9 No. 44, 1980); publicity brochures, specification sheets, photos, technical reports, research papers, reviews.

Windmill Specifications : (Electricity generating windmills)

Turbine type :	Vertical Axis Darrieus
Rotor diameter :	4.6 mt
No. of blades :	3
Blade material :	Aluminium 6061-T6
Weight rotor :	140 kg

Weight System

(a) Wind turbine alone :	360 kg
(b) With alternator and starter :	480 kg
(c) With dual induction generator - starter :	448 kg

Operational wind velocity :	4.4 mt/sec to 17.8 mt/sec
Governing :	disc brake aerodynamic stall
Power output at 10.7 mt/sec :	330 W

U.S.A.

Telephone : 616-378-2000

Product :

Wind Turbine Generator Systems.

Windmill Specifications :

Environmental Energies' Helical Wind Turbine features a high torque, slow speed Helical Airfoil developed for low to moderate wind characteristics. The newly patented horizontal axis wind machine employs 4-blade sets spaced in-depth and indexed helically. The hub assembly is self-governing, requiring no feathering mechanism; the generator is manufactured by general.

Electricity generating windmills.

33. * Hinton Research & Development Corp. ,
417, Kensington,
Salt Lake City, UT. 84115,
U.S.A.

Telephone : 801-487-3896

Windmill Specifications :

Hinton's 3 kw wind turbine generator has an 11' diameter 2-blade propeller on a horizontal axis. Blades are manufactured by compression molded epoxy fiberglass over a polyurethane core. Two small centrifugally-operated governing blades provide rpm control. An oil bath gear box connects a 12 pole synchronous alternator. Output is 48 or 120 VDC. An optical inverter produces 60 cycles a-c power or operates in parallel with the utility system.

34. Independent Energy Systems, Inc. ,
6043 Sterreltania Rd. ,
Fairview, PA. 16415,
U.S.A.

Telephone : 814-833-3567

Activities :

Site analysis, installation and service on all products, replacement parts for old Jacob Wind Plants, installation supervisors provided for wind systems anywhere in the world, manufacturing and selling wind machines.

Wind Electric Generators

Products :

Anemometers; small wind turbine generators; towers; tri blade wind machines; utility interface/inverters; wind direction indicators.

Publications :

'Independent Energy Systems, Inc., Catalog #217', data sheets, brochures.

Windmill Specifications : (Electricity generating windmill)

Model	SKY HAWK II	SKY HAWK IV
Rotor diameter	4.12 mt	4.57 mt
No. of blades	3	3
Blade material	aircraft quality Sitka Spruce	
System weight	220 kg	272 kg
Cut-in-windspeed	3.1 mt/sec	3.1 mt/sec
Cut-off-windspeed	22.4 mt/sec	22.4 mt/sec
Governing	Centrifugally activated blade pitch	
Max. output at 12.1 mt/sec.	2000 W	4000 W
Generator	140 V, DC	

Following windmill systems using the 4 kw Sky Hawk generator are sold by Independent Energy, Inc.

- 1) System 770 DC/AC
- 2) System 780 DC/AC
- 3) System 781 DC only
- 4) System 782 DC/DC Back-up generator
- 5) System 783 AC/Supplementary (recommended for electric-heated homes, large operations, etc.)
- 6) System 784 AC/Power Failure back-up
- 7) System 785 AC/Battery emergency back-up
- 8) System 786 DC/Hot water heating

Route 13, Box 722,
Fort Myers, FL. 33908,
U.S.A.
Telephone : 813-481-3113

Wind Electric Generators

Windmill Specifications :

Jacobs' new kilovolt-ampere wind energy system features variable pitch propeller speed control and completely automatic voltage and charging regulation. The 3-blade, horizontal axis unit has a hypoid gear drive inclined upward 10°. Other features include brushless alternator mounted in a special 8 ft top tower section; patented blade actuated governor; and storm protection control.

36. Jay Carter Enterprise,
P.O. Box 684,
Burkburnett, Texas 76354,
U.S.A.
Telephone : 817-569-2238

Product :

Wind generators.

Publications :

Coloured brochure which includes technical information of the windmill with picture illustrations and graphs.

Windmill Specifications :

Model : JCE Model 25 (Horizontal axis, electricity generating)

Rotor diameter : 9.57 m

No. of blades : 2

Blade material : Fiberglass and PVC foam with continuous filament wound spar

Transmission : Gears

Governing : Automatic

Output :

Rated output at 12.4 mt/sec : 25 kw

Maximum output at 13-18 mt/sec : 30 kw

Generator : Single or 3-phase, 220 or 4410 Volts. 60 cycle AC current.

Tower : 60 feet high galvanized pole supported with 4 guy wires.

Wind Electric Generators

37. Kaman Aerospace Corp.,
Old Windsor Road,
Bloomfield, Connecticut 06002,
U.S.A.
Telephone : 203-242-4461

Contact : William R. Batesole, Manager - Wind
Energy Program

Activities :

Wind energy work commenced in 1974.
Main activities are research and development
(development of a 40 kw horizontal axis wind turbine
generator; development of composite blades for
large wind turbines); production and marketing
(production units of 40 kw planned in early 1982).

Publications :

Reports, research papers, books, monographs,
specification sheets.

Windmill Specifications : (40 kw electricity generating windmill
in prototype phase)

Rotor type :	horizontal axis, down wind.
Rotor diameter :	19.5 mt
No. of blades :	2
Blade material :	Fiberglass
Cut-in-wind speed (mt/sec) :	10
Cut-off-wind speed (mt/sec) :	60
Rated output at 9 mt/sec :	40 kw
Generator :	AC 48 V
Tower :	3 steel, tube legs, self supporting
Applications :	Deep well irrigation pumping and providing power to small isolated communities and small factories.

Budget :

Variable.

Electricity generating windmills.

Wind Electric Generators

57. Trimble Windmills,
55, East Parade,
Harrogate, North Yorkshire HG1 5LQ,
U.K.

Telephone : 0423 501146

Contact : Andrew Stobart, Director, Trimble's Windmill
Limited.

Product :

Multi blade wind machine.

Publications :

Timblemill specification leaflet.

Windmill Specification :

Type : Multiblade horizontal axis, electricity generating windmill.

Rotor diameter :

6 m

Blades :

Sail type

Blade material :

aluminium frame with terylene
sail cloth

Tower :

ductile iron unitary construction
for corrosion resistance

Output :

At windspeed 10 mt/sec :

5 kw

At windspeed 23.6 mt/sec :

12.5 kw

Generator :

AC, 240 V

Applications :

Timblemill is designed primarily
to provide heating for domestic or
agricultural premises. This
heating can be done by hot water via
a central heating system into which
the Trimblemill is connected, or by
hot air using a "night storage" type
of heater which is supplied with
Trimblemill.

Wind Electric Generators

58. * Tumac Industries, i. c. ,
650 Ford St. ,
Colorado Springs, CO. 80915,
U.S.A.
Telephone : 303-596-4400

Product :

Darrieus wind turbine.

Windmill Specifications :

Tumac's 7 by 5 meters Darrieus wind turbine features 2-speed operation; 1 or 3 phase induction generators; synchronized and matched power in volts with utility power; a microcomputer control system and brake protection. The blades are extruded aluminum; output is 1.5 kw at 17.5 mph to 6.8 kw at 31 mph.

59. * Ulrik Poulsen,
Innoventic Aps,
Strandvejen 666,
DK-2930, Klampenborg,
Denmark.

Telephone : (01) 636588

Product :

Electricity generating wind machine.

- 60.* Vendelbo Trapper,
Arne Brogard,
Golstrup Hede 93,
DK-9480 Lokken,
Denmark.
Telephone : (08) 996244

Wind Electric Generators

Product :

Windmill producing electrical power for
water heating.

61. * Volund A/s,
Marsk Stigsvej 4,
DK-9000 Alborg,
Denmark.
Telephone : (08) 139215

Product :

Electricity generating windmills.

62. * Walder Manufacturing Co.,
Route 2, P.O. Box 76,
Galena, KS. 66739,
U.S.A.

Product :

Savonius rotors.

63. Westinghouse Electric Corp.,
Industry Service Div.,
875, Greentree Road,
Building No. 8, Fourth Floor,
Pittsburgh, Pennsylvania 15220,
U.S.A.
Telephone : 412-928-2430

Contact : W.E. Treese, Project Manager, Wind Energy System.

Activities

Currently engaged in 200 kw rated units built in conjunction
with DOE and NASA. Future designs are rated at 500 kw
and up through 750 kw.

Wind Electric Generators

Publications :

Descriptive bulletin : Wind Turbine Generators :
Harvest the wind for energy, specification sheets.

Product :

Large wind turbine generating systems.

Windmill Specifications : Electricity generating windmills

	200 kw	500 kw
Rotor diameter	38.1 mt	38.1 mt
Speed	40 rpm	42 rpm
No. of blades	2	2
Material	Aluminium	Wood
Transmission ratio	45:1	42.86:1
Cut-in-windspeed (at hub)	5 mt/sec	6.3 mt/sec
Cut-off-windspeed (at hub)	17.9 mt/sec	22.4 mt/se
Power output	200 kw	500 kw
Generator	AC 480 V	AC 4160
Tower		
Type	Pipe truss	Pipe truss
Height	93 ft	93 ft

64.* Whirlwind Power Co.,
2458, West 29th Avenue,
Denver, CO. 80211,
U.S.A.

Products :

Dual-blade wind machines; small WTG system;
wind turbine blades.

65 Winco Div. of Dyna Technology,
7850 Metro Parkway,
Minneapolis, MN. 55420,
U.S.A.

Telephone : 612-853-8400

Contact : Len Attema, VP Marketing.

Wind Electric Generators

Activities :

Research and development; production and marketing, extension/promotion.

Publications :

Specification sheets, photographs, technical manuals, brochures.

Products :

Dual-bladed wind machines; small wind turbine generator system; wind driven battery charges (name WINCHARGER).

Windmill Specifications : (Electricity generating windmill)

Rotor diameter	1.8 mt
No. of blades	2
Blade material	wood
Cut-in-speed	3 mt/sec
Cut-off-speed	30 mt/sec
Governing	air brake centrifugally activated
Maximum power output	
.. at 10 mt/sec	200 W
Weight system	60 kg
Tower material	steel
Tower height	3 mt
Generator	12/24 V, DC

66.* The Wind Energy Supply Co. Ltd. (WESCO),
Iroko House,
Bolney Avenue, Peacehaven,
Sussex BN9 8HQ,
U.K.

Product :

Electricity generating windmill.

Wind Electric Generators

67. * Wind-Matric Aps
Vester Lindvej 32,
DK-7400 Herning,
Denmark.
Telephone : (07) 124032

Product :

P.O. Box 17323, San Diego,
CA. 92117,
U.S.A.

Product :

Electricity generating windmills.

69. * WTG Energy Systems, Inc.,
251 Elm Street,
Buffalo, N.Y. 14203,
U.S.A.

Products :

Large wind turbine generator systems; tri-
blade wind machines.

70. Windworks, Inc.,
Rt. 3, Box 44A,
Mukwonago, WI. 53149,
U.S.A.
Telephone : 414-363-4088

Activities :

Non-profit company. Wind energy work commenced in
1970. Designs wind-driven generator systems,
including synchronous inverters and towers, and provides

Wind Electric Generators

design information on a consulting basis.

Publications :

Brochures, documentation and detailed drawings
of 8 kw system.

Windmill Specifications : (Electricity generating, horizontal axis windmill)

Model	WINDWORKER 10
Rotor diameter	10 mt
No. of blades	3 (free flapping blades)
Blade material	aluminium
Cut-in-windspeed	3.5 mt/sec
Survival windspeed	75 mt/sec
Transmission	direct drive
Maximum power output	10 kw (permanent magnet inverter achieves full power output at 15 rpm. Output is converted to line voltage and frequency by Gemini Synchronous Inverter)
Tower (various heights)	18 mt, 24 mt or 30 mt
Tower material	steel
Generator	DC

- 71.* Winflo Power Ltd.,
Unit 15, 90, Esna Park,
Drive Markham, Ontario,
Canada L3R 2R1.

Product :

Electricity generating windmill.

P.O. Box 241,
Brunswick, Maine,
ME. 04011,
U.S.A.

Telephone : 207-725 6534

Wind Electric Generators

Contact : Richard Vaglia, Customer Services.

Products :

Small wind turbine generator systems; vertical axis wind machines;(VLS-PA) alternators for wind powered systems.

Publications :

Product information sheets (drawings, graphs, diagrams)

Windmill Specifications : (Electricity generating windmill)

Model	tetrahelix S, vertical axis, gyromill
Rotor diameter (mt)	0.6
Blade materials	dacron, nylon, aluminium, kevlar ties
Weight rotor (kg)	1.35
Weight system (kg)	2.25
Cut-in-windspeed (mt/sec)	5.3
Cut-off-windspeed (mt/sec)	none
Governing	non-destructive collapse in high winds
Max. power output at 11 mt/sec	7 W
Generator	14V DC permanent magnet

WATER PUMPING WINDMILLS

Water Pumping Windmills

Windmill Specifications : Water pumping windmills in 5 models :
CADETEOL, SUPERCADETEOL,
JUNIOREOL, GEANTEOL, and
GOLIATEOL.

<u>MODEL</u>	<u>CADETEOL</u>	<u>SUPERCADETEOL</u>
No. of blades	6	8
Rotor diameter	1.75 m	1.75 m
Cut in speed	2.5 m/s	2.5 m/s
Cut off speed	10 m/s	10 m/s
Governing	automatic	automatic
Max. pumping depth	7 m	12 m
Max. output	500 litres/hr	600 litres/hr
Total weight	165 kg	165 kg

<u>MODEL</u>	<u>JUNIOREOL</u>	<u>GEANTEOL</u>
No. of blades	16	16
Rotor diameter	2m, 2.25m, 2.5m	3.5m, 4m, 5m
(various sizes)	2.75 m	
Head	'IDEE' or 'IDEALE' with fixed stroke	Head No. 1 or No. 2 with adjustable strokes
	'IDEALO' or 'IDEESSSE' with adjustable strokes	
Max. output	2000 litres/hr	25,000 litres/hr
Max. pumping depth	40 m	170 m
Tower height	5.25m, 6.55m, 8.85m	5.3m, 9.3m
(different sizes)	12.3m	13.3m
Total weight	400 kg to 800 kg	Approx. 2000 kg

(Other parts include rudder, outlet pipe,
delivery device)

MODEL GALIATEOL, a heavy duty machine is
being prepared and will be marketed after summer
1981. Its maximum planned output will be
100,000 litres/hr.

Water Pumping Windmills

Product :

Multiblade windmills for pumping water.

Windmill Specifications : (Horizontal axis, multi-bladed water pumping windmill)

Special Features :

Low cut-in velocity, back geared, automatic regulation, fully lubricated, adjustable strokes, low maintenance.

Blade material : galvanised steel

Cut-in-speed : 7/8 km. p.h.

Pumping power capacity at 25 km. p.h. windspeed is shown below :

MODEL: DW - 200 G			MODEL: DW - 400 G	
elevation metres	Cylinder Size Millimetres	Rated Pumping Capacity Litres/Hour	Cylinder Size Millimetres	Rated Capacity Litres/Hour
4 m	100 mm	3000 lts/hr	175 mm	18000 lts/hr
30 m	45 mm	650 lts/hr	80 mm	3300 lts/hr
90 m			45 mm	800 lts/hr

Wayland Works,
Whitchurch, Salop SY13 1RS,
England.

Telephone : 2526/7/8

Contact : W.W. Wyatt and R.D. Wyatt, Directors.

Products :

Water pumping windmills; wind pumps for shallow wells (suitable for total suction lift up to 25 feet); wind pumps for deep wells (more than 25 feet deep).

Water Pumping Windmills

Publications :

Publication No. 103 which shows the full range of Climax Windmills.

Windmill Specifications :

Currently 8 ft, 16 ft, and 18 ft mills are being made on towers 15 ft to 60 ft high. Climax windmills are multi bladed. Except for the smallest size, every mill has a variable stroke. Duplex machine cut gears are provided. There is an automatic governing device and the towers, sailwheel and tailvane are hot dip galvanized after manufacture as a general guide, a windmill of 12 ft size and under will commence pumping in a breeze of 8-7 mph and the larger windmills in one of 8-9 mph.
